About this information .................................. v

Chapter 1. DB2 Utilities Solution Pack for z/OS overview .......... 1
  What is the DB2 Utilities Solution Pack for z/OS? . . . . 1
  Benefits ........................................ 1
  Proactive administration of your DB2 environment .... 4
  Scenario: Improving the performance of a DB2 utility
  by using the DB2 Utilities Enhancement Tool . . . . 7
  Scenario: Improving the sort processing performance
  of the DB2 utilities ................................ 7
  Scenario: Unloading DB2 data with DB2 High
  Performance Unload and DB2 Sort ............ 8
  Scenario: Reducing processor consumption by
  automating routine maintenance .................. 9
  Scenario: Modernization of maintenance and
  administration tasks in Management Console . 10
  Scenario: Monitoring and problem determination in
  Management Console ............................. 10
  Service updates and support information .... 11
  Product documentation and updates .......... 11
  Accessibility features .......................... 12

Chapter 2. Preparing to customize DB2 Utilities Solution Pack ........ 15
  Environment setup .................................. 18
  DB2 Utilities Solution Pack: Set up your
  environment prior to customization .......... 18
  Set up your environment prior to customization 19
  Hardware and software requirements ....... 22
  Set up your environment prior to customization 23
  Deployment considerations .................... 25
  Deployment considerations: DB2 Automation
  Tool ............................................. 25
  Deployment considerations: DB2 Sort .......... 26
  Deployment considerations: DB2 Utilities
  Enhancement Tool .............................. 30
  Worksheets: Data set names and parameters .... 37
  Worksheets: DB2 Utilities Solution Pack .... 37
  Worksheets: DB2 Automation Tool .......... 37
  Worksheets: DB2 High Performance Unload . 67
  Worksheets: DB2 Sort .......................... 132
  Worksheets: DB2 Utilities Enhancement Tool 135
  Worksheets: Gathering parameter values for Tools
  Customizer .................................. 157

Chapter 3. Pre-customization tasks 161
  Pre-customization tasks: DB2 High Performance
  Unload ........................................ 161
  Authorizing and enabling DB2 HPU .............. 161
  Optional: Creating a TSO command for the DB2
  HPU interactive component .................... 161
  Pre-customization tasks: DB2 Sort .......... 162
  Activating DB2 Sort .......................... 162

Chapter 4. Starting and preparing Tools Customizer for use .... 163
  Best Practice: SMP/E and runtime libraries
  maintenance strategy for Tools Customizer .... 163
  Starting Tools Customizer .................... 167
  Modifying Tools Customizer user settings ...... 168
  Hiding and displaying panel text .............. 171

Chapter 5. Customizing components in the DB2 Utilities Solution Pack . . 173
  Roadmap: Customizing components for the first
  time .......................................... 173
  Roadmap: Customizing new versions of
  components from a previous customization . 174
  Roadmap: Recustomizing components .......... 175
  Specifying the metadata library for the pack to
  customize ................................... 177
  Selecting components to customize ............ 178
  Discovering component information automatically 179
  Creating and associating DB2 entries .......... 181
  Defining parameters .......................... 183
    Defining component parameters ............. 183
    Defining LPAR parameters ................ 185
    Defining DB2 parameters ................ 186
  Generating customization jobs ............... 188
  Submitting customization jobs ............... 189
  Browsing parameters ......................... 191
  Copying DB2 entries .......................... 191
  Removing DB2 entries .......................... 193
  Deleting DB2 entries .......................... 193
  Displaying customization jobs ............... 194
  Maintaining customization jobs ............. 194
  Using Tools Customizer in a multiple-LPAR
  environment .................................. 194

Chapter 6. Post-customization tasks 197
  Post-customization tasks: DB2 Automation Tool 197
    Creating multiple configurations of DB2
    Automation Tool ............................. 197
  Post-customization tasks: DB2 High Performance
  Unload ........................................ 198
    Optional: Integrating DB2 HPU into DB2 Tools
    Launchpad .................................. 198
    Optional: Integrating DB2 HPU into DB2
    Administration Tool ......................... 199
  Post-customization tasks: DB2 Sort .......... 200
    Accessing DB2 Sort libraries .............. 200
    Installation Verification Program: Overview . 201
    Using Installation Verification Program . 201
    Generating an IVP report .................. 202
  Post-customization tasks: DB2 Utilities
  Enhancement Tool ............................ 203

About this information

DB2 Utilities Solution Pack is a product that combines a number of IBM components into a consolidated solution that enables enterprises to efficiently and intelligently run utilities, while optimizing the performance of daily utilities management activities.

DB2 Utilities Solution Pack combines the following components into a single offering:
- DB2 Automation Tool for z/OS V4.2
- DB2 High Performance Unload for z/OS V4.3
- DB2 Sort for z/OS V2.1
- DB2 Utilities Enhancement Tool for z/OS V2.2

These topics provide an overview of the components and capabilities that are delivered with DB2 Utilities Solution Pack and some common usage scenarios to help you understand the capabilities of the product. These topics also provide comprehensive instructions for customizing the solution pack after a successful SMP/E installation.

These topics are designed to help database administrators, system programmers, application programmers, and system operators perform the following tasks:
- Understand the capabilities of the functions that are associated with the solution pack
- Perform the pre-customization tasks for the components
- Customize the components of the solution pack
- Troubleshoot any errors that might occur during the customization process

To use the functions that are described in this information, you must have already installed DB2 Utilities Solution Pack by completing the SMP/E installation process that is documented in the Program Directory for DB2 Utilities Solution Pack, GI10-9005.

To use these topics, you should have a working knowledge of:
- The z/OS operating system
- ISPF

Always check the DB2 Tools Product Documentation page for the most current version of this information:

http://www.ibm.com/software/data/db2imstools/db2tools-library.html
Chapter 1. DB2 Utilities Solution Pack for z/OS overview

IBM® DB2® Utilities Solution Pack for z/OS® (also referred to as DB2 Utilities Solution Pack) combines powerful DB2 tools that, when used together, can improve utility performance and simplify utility management.

What is the DB2 Utilities Solution Pack for z/OS?

DB2 Utilities Solution Pack is a set of functionally compatible components.

DB2 Utilities Solution Pack includes the following components:

**IBM DB2 Automation Tool for z/OS (also referred to as DB2 Automation Tool)**
- You can use this component to set up recurring utility jobs for conditional and routine DB2 maintenance tasks. You can also automate common DB2 maintenance tasks and generate JCL for more complex tasks on one or more objects.

**DB2 High Performance Unload for z/OS (also referred to as DB2 High Performance Unload)**
- This component offers performance options for unloading and extracting large amounts of data across the enterprise. Because HPU works outside of the DB2 address space, it does not compete for the same DB2 resources.

**DB2 Sort for z/OS (also referred to as DB2 Sort)**
- Sort processing of large volumes of data, large table spaces, or large indexes typically requires intensive processor usage and heavy I/O activity. Large amounts of memory and disk space can be required for this sort processing. DB2 Sort meets these demands by optimizing the use of memory, using zIIP technology, and optimizing the management of disk space that is used for sort work.

**DB2 Utilities Enhancement Tool for z/OS (also referred to as DB2 Utilities Enhancement Tool)**
- This component provides additional utility features and the ability to set company-wide standards for executing DB2 syntax. The tool enhances the DB2 LOAD, REORG TABLESPACE, and CHECK DATA utilities. Additionally, DB2 Utilities Enhancement Tool can block and cancel threads on DB2 objects for other DB2 online utilities and for any programs that use a DB2 database.

Benefits

By using DB2 Utilities Solution Pack, you can simplify the management and operation of your utilities and improve their performance at the same time.

DB2 Utilities Solution Pack provides the following benefits:

**Proactive administration of your DB2 environment**
- Today's global enterprise faces unprecedented challenges as it strives to recruit, train, deploy, and retain expert IT staff on the mainframe. Even the best information management professionals work with ever-increasing constraints of time, skill, and resources.
As database administrators retire, a global business needs innovative approaches to maintain its investment in mainframe skills. New IT professionals who replace retiring DBAs typically need up to five years of experience to effectively meet critical business requirements for a healthy, optimized, available DB2 environment. At the same time, experienced DBAs should not spend most of their time navigating ISPF panels when they might otherwise be setting strategic direction for the business. To whatever extent you can automate routine administrative tasks and minimize the need for decades of mainframe experience, the enterprise benefits.

IBM Management Console for IMS™ and DB2 for z/OS and IBM Autonomics Director for DB2 for z/OS provide the tools that you need to optimize both DB2 administration and your workforce. In combination with DB2 Utilities Solution Pack, these tools help you to meet demanding service level agreements in a complex global business environment. They provide the following advantages:

- A consolidated view of your DB2 environment an intuitive, graphical web interface
- Configuration and setup options to help you achieve the precise level of automation that your business requires for database monitoring and maintenance tasks

For more information, see “Proactive administration of your DB2 environment” on page 4.

Integrated monitoring and maintenance among pack components

DB2 Automation Tool

- User-defined thresholds enable you to monitor DB2 objects at any time interval, and then take any corrective action that you define for each symptom.
- Autonomics Director for DB2 can proactively take actions that DB2 Automation Tool does already. Instead of waiting for user intervention to resolve a condition, you can take appropriate action automatically when your tools environment detects that DB2 exceeded a specified threshold.
- Autonomics enablement features that are available in DB2 Automation Tool feed alerts and recommendations to Management Console for a one-stop view of DB2 status and health.

DB2 High Performance Unload

- LOB and XML features support unloading LOB and XML data from image copies.
- OUTPUT data supports SPANNED FORMAT.
- ORDER CLUSTER or ORDER BY options are supported for UNLOAD FORMAT INTERNAL
- When you unload from image copy, you can use OBID_REPORT with a non-production run to obtain a list of object IDs.

DB2 Sort

- DB2 Sort works with DB2 High Performance Unload and DB2 Utilities Enhancement Tool to read files directly before performing a sort.
When you specify that DB2 Sort processes sorts for DB2 Utilities and other DB2 management tools, you can significantly reduce processor consumption and performance. You do this by running DB2 LOAD with the extended syntax that DB2 Utilities Enhancement Tool provides, such as PRESORT, CONSTANT and VALUEIF.

**DB2 Utilities Enhancement Tool**

- DB2 Utilities Enhancement Tool works with DB2 Automation Tool to generate the mapping table and mapping-table index when running a REORG TABLESPACE.
- DB2 Utilities Enhancement Tool sends statistics to Autonomics Director for DB2 that help with workload balancing.

**Increased availability**

DB2 DB2 Utilities Enhancement Tool provides greater control over utility operations. The following examples describe some of the benefits:
- Reduces application downtime by maintaining access to business-critical objects
- Reduces DBA intervention by canceling threads automatically

**Optimized processor utilization**

DB2 DB2 Utilities Enhancement Tool provides significant savings on costly processor consumption:
- Saves on processor utilization and elapsed time by automatically creating the mapping table during a REORG
- Reduces processor utilization and elapsed time with the PRESORT option during a LOAD
- Reduces repeated CPU consumption by ensuring utilities run successfully the first time
- Improves availability and efficiency by using the DB2 Automation Tool to generate CHECK DATA on related sets of objects. DB2 DB2 Utilities Enhancement Tool then discards data rows to a flat file.

**More efficient LOAD and UNLOAD operations**

The DB2 High Performance Unload component alleviates some of the problems that are associated with unloading large amounts of data. Because of the large amount of time consumed by large sequential reads of DB2 tables, UNLOAD operations are difficult to schedule during increasingly-shrinking batch windows. Performance issues can become critical when several UNLOAD operations read the same table space concurrently.

In this situation, DB2 buffer pool management can cause multiple programs to compete for the same data. This competition among multiple programs can result in the following challenges:
- Conflicts in the use of the DB2 buffer pool
- Overwrites of buffers that are serving several UNLOAD operations
- Multiple reads of the same DB2 pages
- Channel conflicts

To address these problems, DB2 High Performance Unload provides a fast way to sequentially read and share a DB2 table space among multiple unloads. Whenever possible, DB2 High Performance Unload processes
requests to unload data from the same table space in parallel. You can create different output files during the same UNLOAD process at almost no additional cost.

For example, you can unload a list of customers who have payments due this week and another list of customers whose birthdays are on the first day of the week. You can create these lists in a single execution of DB2 High Performance Unload at a fraction of the cost that is required by traditional approaches that run UNLOAD operations twice.

DB2 High Performance Unload can decrease the time it takes to unload certain DB2 tables by invoking DB2 Sort. You can increase performance when DB2 must sort the result set or when unloading from a traditional or inline image copy.

**Improved sort processing**

DB2 Sort improves the performance of utility sort processing, especially in environments with large volumes of data, large table spaces, or large indexes.

**Efficient and secure utility syntax management**

The Utility Syntax Monitor that is available in the DB2 Utilities Enhancement Tool has robust capabilities to help you with utility syntax. The following are only some of the advantages that the monitor can provide:

- Enables you to establish and maintain company-wide DB2 utility syntax policies
- Extends utility syntax to reduce system costs and improve availability
- Provides an additional layer of security to protect business critical objects and ensure a secure recovery strategy
- Enables you to take advantage of new DB2 utility syntax without changing JCL, thereby reducing costs and avoiding the need to change multiple batch jobs

**Proactive administration of your DB2 environment**

Management Console and Autonomics Director for DB2 consolidate features of the tools in the DB2 Utilities Solution Pack to provide a self-monitoring, self-diagnosing, and self-healing monitoring and maintenance system.

**Overview**

The DB2 Utilities Solution Pack is a comprehensive monitoring and administration solution that helps you to manage, optimize, control, and automate your DB2 environment. It is the cornerstone of an *autonomics solution* that helps you to anticipate and avoid emergency situations and high-severity problems before they occur. DB2 Utilities Solution Pack also helps you to maintain availability, integrity, and security, and comply with service level agreements. The ability to optimize performance is also an essential component of the solution.

In combination with Autonomics Director for DB2 and Management Console, the DB2 Utilities Solution Pack provides the precise level of automation and scheduled maintenance that your business requires to supplement manual approaches. Thanks to a robust set of configuration options based on policies and profiles, you are in complete control. You decide which actions to automate and which to perform manually.
The pack offers easy-to-configure policy services that build intelligence into utilities and tools management. In addition to the real-time statistics (RTS) that DB2 generates, including DB2 sensor data that any tool can access, Autonomics Director for DB2 adds an additional layer of features that enable you to define policies. These policies recommend or automate recurring DB2 monitoring and maintenance tasks, including the ability to schedule the collection and evaluation of the sensor data.

Autonomics Director for DB2 collects these point-in-time statistics about database health and stores them in a central repository. It evaluates the sensor data, and then compares the values to thresholds that you define in the policies. If DB2 activities exceed a threshold that you specify, Autonomics Director for DB2 generates an exception. You then have the option to define actions, such as triggering notifications or launching processes, that Autonomics Director for DB2 takes in response to the exceptions.

Management Console

Management Console modernizes mainframe administration by providing a single, intuitive, and modern web-based interface that configures, administers, automates, and optimizes the performance of your DB2 environment. It consolidates data from multiple DB2 tools, including tools from non-IBM vendors, and presents a more complete picture of those systems and databases. You can use the comprehensive context-sensitive help system included with Management Console as a teaching aid for new DBAs and system programmers.

Today’s global enterprise must manage larger and more complex information management environments. With this increased complexity comes more data and larger tables; more subsystems, objects, and bufferpools; and new utility and metadata options. As the number of experienced DBAs in the workplace declines, your business must focus on efficiency, choose the right options, and avoid unnecessary work. Management Console provides a comprehensive view of your databases and tools that builds upon the existing capabilities of DB2 Automation Tool to maximize efficiency and availability.

Administrative capabilities

- Database administration
- Catalog navigation
- Policy management
- Automated action and alert resolution
- Manual action and alert resolution

Automation and performance features

- Monitor DB2
- Read policies
- Generate or modify actions and alerts
- Generate and resolve alerts and actions

Features of an autonomies strategy

Simple setup and administration

Management Console provides central oversight, default profiles, and a new graphical user interface in addition to the 3270 interface.

Staged enablement from passive to active stages of management
You can define profiles that manage all database objects from individual tables to the entire DB2 environment.

**Transparency based upon existing autonomic infrastructure**

Your autonomies strategy builds on existing DB2 capabilities and infrastructure, including tables, stored procedures, and the Administrative Scheduler. Integration with batch schedulers enables you to run the maintenance jobs that you require during maintenance windows.

**Preservation of existing profiles and utilities**

Build on the existing profiles and logic that are found in DB2 Automation Tool and DB2 Utilities Enhancement Tool to automate REORG, COPY, and RUNSTATS operations and incorporate existing batch utilities into your autonomies strategy.

**Extensibility that integrates other tools and products**

The DB2 tools in the DB2 Utilities Solution Pack work with all available tools, utilities, and actions as part of a comprehensive solution. Examples of this extensibility include Optim™ Query Workload Tuner, performance tools, and activities that are not performed by utilities, such as WTOs and SMS texts.

**Autonomic activities**

Autonomics Director for DB2 performs both active and passive activities. The following stages describe the passive activities:

- **Collect data**: Schedule or trigger data collection; view historical data.
- **Analyze and identify symptoms**: Schedule or initiate analysis; view and dismiss symptoms.
- **Diagnose and prescribe action**: View recommendations.

The following stages are active:

- **Plan and schedule maintenance window**: Define maintenance windows; view and fine tune maintenance windows.
- **Perform and take action**: Schedule or initiate specific actions.

In any stage of the process, you decide when and how to analyze, identify, diagnose, prescribe, and take action. The following user-defined profiles put you in complete control of the actions that you undertake, either manually or automatically:

- Exception profiles (alerts, thresholds)
- Object profiles
- Utility profiles
- Alert profiles
- Maintenance profiles

The following examples describe typical actions that Autonomics Director for DB2 might recommend:

- DB2 REORG
- Image copy (IC) operations
- RUNSTATS operations
For example, you can monitor your DB2 environment continuously for thresholds and policy compliance issues. Instead of running DB2 Automation tool during batch windows, you can trigger a run in response to conditions in the environment. You can set alerts and thresholds in DB2 Automation Tool, and then when a threshold reached, initiate a REORG manually or automatically in response to the alert.

**Scenario: Improving the performance of a DB2 utility by using the DB2 Utilities Enhancement Tool**

You can improve the performance of a DB2 utility by using a DB2 Utilities Enhancement Tool *intercept policy*.

An intercept policy enables you to dynamically change the DB2 utility syntax at run time without manually changing JCL, which is a process that is time consuming and error prone.

Consider the following scenario: the DB2 LOAD utility is loading records from unloaded tables before the records are sorted. Because the DB2 LOAD utility loads presorted records faster, it is advantageous to have the data rows in sort order before the utility loads them. DB2 Sort can presort the records and has superior sort performance over the DB2 DFSORT utility. However, manually adding a sort step to a LOAD utility job, for the purpose of presorting a SYSREC file, can be time-consuming. Imagine the time that it could take, especially if there are dozens or perhaps hundreds of LOAD utility jobs in your environment. Can you dynamically change your run time environment for the DB2 LOAD utility so that DB2 Sort can presort the input records? Yes.

An intercept policy also lets you change the DB2 LOAD utility syntax at run time based on the rules that are defined in the policy. In other words, you can add parameters that are not currently present in the LOAD utility syntax. For example, if the PRESORT option is present in the LOAD utility syntax, the intercept policy can add the PRESORTED YES option to the LOAD control statement at run time. The PRESORT option invokes DB2 Sort to sort the rows in the input data set by table object identifier (OBID) and by clustering index key. The PRESORTED YES option tells the DB2 LOAD utility to load the input records immediately because they are presorted.

Here is the relevant `<UTILITY>` section in a sample intercept policy:

```
<UTILITY NAME="LOAD">
  <MONITOR>
    <SYNTAX ADD="PRESORTED YES" OPTIONIF="PRESORT"/>
    <SYNTAX REMOVE="SPANNED YES"/>
    <MESSAGE ID="DSNU1150I" RETURN_CODE="4"/>
  </MONITOR>
</UTILITY>
```

**Scenario: Improving the sort processing performance of the DB2 utilities**

DB2 Sort offers superior sort performance over the DB2 DFSORT utility, and can improve the sort processing performance of several DB2 utilities.

Consider the following scenario: suppose that your enterprise uses the DFSORT utility for all sort processing. A significant number of objects in your enterprise are large, and working with these objects results in an abundant amount of sorting.
activity. Because sort processing is done by many of the DB2 utilities, you might reduce processor and elapsed times by using DB2 Sort.

DB2 Sort supports the following DB2 utilities:
- CHECK INDEX
- CHECK LOB
- LOAD
- REBUILD INDEX

To invoke DB2 Sort from these utilities automatically, after DB2 Utilities Solution Pack is customized, set the DB2 subsystem parameter, `DB2SORT`, to ENABLE.

You can further integrate DB2 Sort into your DB2 environment by using DB2 Automation Tool. DB2 Automation Tool supports the following DB2 utilities:
- CHECK DATA
- REORG TABLESPACE
- RUNSTATS

After the DB2 Utilities Solution Pack is customized, the CHECK DATA, REORG TABLESPACE, and RUNSTATS utilities invoke DB2 Sort by default for any sort processing.

**Scenario: Unloading DB2 data with DB2 High Performance Unload and DB2 Sort**

You can decrease the amount of time that is required to unload DB2 tables by using DB2 High Performance Unload in conjunction with DB2 Sort.

Consider the following scenario: a banking company in the United States is opening a European branch and needs to transfer its customer accounts to a database in Europe.

Before the data can be unloaded, the senior DBA must consider the following factors:

**Size of the table**
- The table is large; it contains over 15 million rows.

**Date format of the columns**
- In the United States, the MM-DD-YYYY format is used, whereas in Europe, the DD-MM-YYYY format is used. Data, therefore, must be unloaded in the European format.

**Performance**
- Data must be unloaded as fast as possible.

Using DB2 High Performance Unload in conjunction with DB2 Sort is ideal for this scenario for the following reasons:
- DB2 High Performance Unload has a performance advantage over the DB2 Unload utility when unloading large tables.
- DB2 Sort has superior sort performance over the DFSORT utility. DB2 Sort can be invoked for complicated SELECT clauses that require access to the DB2 index (such as ORDER BY and WHERE clauses). Because DB2 Sort can be invoked, these SQL clauses do not slow down the unload process because the syntax does not need to be passed to DB2 for interpretation.
About this task

The senior DBA who implements this scenario must perform the steps outlined in this scenario.

1. Ensure that they have the required privileges for running DB2 HPU.
   For a list of the privileges that are required, see the DB2 HPU 4.2 User’s Guide.
2. Code the job with the required SYSIN DD options and save it.
   Here is an example:
   ```
   GLOBAL SORTUTIL DB2SORT ;
   UNLOAD TABLESPACE QUIESCE YES QUIESCECAT YES
   SELECT FNAME,NAME, ADDRESS, DATE_B
   FROM CUSTOMER ORDER BY NAME
   OUTDDN (SYSUT1)
   FORMAT USER (COL FNAME NULLID YES,
   COL 3 TYPE CHARACTER(100)
   JUST RIGHT,
   COL 004 TYPE DATE_E )
   LOADDON LOAD1
   LOADOPT (RESUME YES)
   ```
   In this example, SYSUT1 is DD name for the output data set and LOAD1 is the DD name for the LOADDN data set.
   Sample JCL for unloading a table can be found in the DB2 HPU 4.2 User’s Guide.
3. Submit the job.

Results

DB2 High Performance Unload unloads the CUSTOMER table from the banking database and converts all of the columns that contain dates to the European date format. The DBA can now send the output and load files to colleagues in Europe so that they can load the data into their own database.

---

**Scenario: Reducing processor consumption by automating routine maintenance**

You can reduce the amount of processor resources that routine maintenance consumes by automatically generating JCL for only those objects that need maintenance.

Consider the following scenario: suppose that your enterprise has routine batch JCL jobs that are submitted on a regular basis for running utilities. Maintenance jobs, such as generating image copies, reorganizing table spaces and indexes, checking data, and so on, are critical for ensuring that business data remains accessible. Suppose further that the allocated batch maintenance window is full, and that a significant number of objects must be maintained within that window. Adding additional utilities or objects can put a strain on an already full maintenance window.

By using DB2 Automation Tool, you can apply filter criteria against the objects that you define to selectively generate utility JCL for only those objects that need maintenance. Instead of you routinely running utilities against objects whether...
those objects need maintenance or not, DB2 Automation Tool determines which
objects need maintenance and generates utility JCL for only objects that need it.
The result: processor resources are saved.

DB2 Automation Tool can evaluate database objects by applying over 180 exception
criteria to determine which objects need maintenance and which objects do not.
DB2 Automation Tool can generate this JCL without any intervention from the
database administrator. By running maintenance utility JCL against only those
objects that need it, you consume less processor resources, and reduce the strain on
your batch maintenance window.

Scenario: Modernization of maintenance and administration tasks in
Management Console

A DB2 database administrator with 25 years of experience changes a reactive
response to an alert to a proactive autonomic approach that anticipates similar
problems in the future.

A DBA manages DB2 databases for a global retail enterprise. He also mentors
peers who have less experience with DB2 databases on z/OS. One morning, he
receives a mobile alert that indicates multiple problems in a DB2 subsystem. When
he arrives at work, he logs in to the Alerts Dashboard in Management Console to
review a set of critical exceptions.

The DBA drills down into the inventory database, where he quickly and easily
identifies the problem. One of his table spaces needs to be reorganized. After the
REORG process is complete, he decides to take proactive action that will detect
similar problems automatically in the future. He schedules an active autonomies
REORG that will perform this maintenance task automatically before the state of
the database reaches a critical point again.

The DBA opens the autonomics scheduler and reviews the existing schedules. He
creates a new schedule for the REORG, and then reviews the list of jobs that are in
queue for the next maintenance window. He defines profiles that will monitor the
required DB2 objects, generate the alerts, trigger the appropriate actions, and
schedule the maintenance job in the next batch window. As he defines options for
the RUNSTATS utility, best practices are displayed in the console by default.

If the same conditions recur, the REORG task will run automatically and address
the problem before it reaches a critical juncture. Instead of reacting to phone calls
and alerts, the DBA can avoid crisis management and attend to more urgent
priorities.

Scenario: Monitoring and problem determination in Management
Console

A DB2 database administrator uses Management Console to identify database
changes and to determine which maintenance tasks should be automated or
performed manually, resulting in more efficient staff utilization and massive
performance improvements.

A DBA who works for a global banking enterprise reviews properties and key
metrics for an important member of the data sharing environment. The DBA and
system programmer recently completed a customization process that tailored
Management Console to display dashboards and other information that are
relevant to their site.

In the console, she drills down for more information about the top three table
spaces. A series of views that enable her to review properties, alerts, and table space
size over time helps her to identify some changes that she wants to make to the
database. The DBA selects each table space in turn, drills down, and reviews
detailed graphs and recommendations.

The DBA sets up an active autonomies policy to schedule the RUNSTATS utility if
certain thresholds are exceeded. Noting that the same exception is appearing
repeatedly for one of the table spaces, she sets a flag to prevent automatic REORGS
for that table space. She takes an additional proactive action to avoid future
truncation problems with long names by increasing the length of the City column
in one of the tables from 32 to 64 characters.

In the final stage of the review, the DBA creates an active autonomies policy to
schedule queries for routing to the DB2 Analytics Accelerator. Queries that reach a
certain threshold that qualifies them for acceleration now trigger a process that
adds their tables to the accelerator automatically. The resulting improvements to
the performance of business intelligence queries are so great that the DBA
schedules a special meeting with upper management to report on the radically
improved performance.

Service updates and support information

Service updates and support information for this product, including software fix
packs, PTFs, frequently asked questions (FAQs), technical notes, troubleshooting
information, and downloads, are available from the web.

To find service updates and support information, see the following website:

http://www.ibm.com/support/entry/portal/Overview/Software/
Information_Management/DB2_Tools_for_z~OS

Product documentation and updates

DB2 Tools information is available at multiple places on the web. You can receive
updates to DB2 Tools information automatically by registering with the IBM My
Notifications service.

Information on the web

The DB2 Tools Product Documentation web page provides current product
documentation that you can view, print, and download. To locate publications with
the most up-to-date information, refer to the following web page:

http://www.ibm.com/software/data/db2imstools/db2tools-library.html

You can also access documentation for many DB2 Tools from IBM Knowledge
Center:

http://www.ibm.com/support/knowledgecenter
Search for a specific DB2 Tool product or browse the Information Management > DB2 for z/OS family.

IBM Redbooks® publications that cover DB2 Tools are available from the following web page:

http://www.redbooks.ibm.com

The Data Management Tools Solutions website shows how IBM solutions can help IT organizations maximize their investment in DB2 databases while staying ahead of today's top data management challenges:

Receiving documentation updates automatically

To automatically receive emails that notify you when new technote documents are released, when existing product documentation is updated, and when new product documentation is available, you can register with the IBM My Notifications service. You can customize the service so that you receive information about only those IBM products that you specify.

To register with the My Notifications service:

1. Go to http://www.ibm.com/support/mysupport
2. Enter your IBM ID and password, or create one by clicking register now.
3. When the My Notifications page is displayed, click Subscribe to select those products that you want to receive information updates about. The DB2 Tools option is located under Software > Information Management.
4. Click Continue to specify the types of updates that you want to receive.
5. Click Submit to save your profile.

How to send your comments

Your feedback is important in helping to provide the most accurate and high-quality information. If you have any comments about this book or any other IBM product documentation, use one of the following options:

- Use the online reader comment form, which is located at http://www.ibm.com/software/data/rcf/
- Send your comments by email to comments@us.ibm.com. Include the name of the book, the part number of the book, the version of the product that you are using, and, if applicable, the specific location of the text you are commenting on, for example, a page number or table number.

Accessibility features

Accessibility features help a user who has a physical disability, such as restricted mobility or limited vision, to use a software product successfully.

The major accessibility features in this product enable users to perform the following activities:

- Use assistive technologies such as screen readers and screen magnifier software. Consult the assistive technology documentation for specific information when using it to access z/OS interfaces.
- Customize display attributes such as color, contrast, and font size.
• Operate specific or equivalent features by using only the keyboard. Refer to the following publications for information about accessing ISPF interfaces:
  – z/OS ISPF User’s Guide, Volume 1
  – z/OS TSO/E Primer
  – z/OS TSO/E User’s Guide

These guides describe how to use the ISPF interface, including the use of keyboard shortcuts or function keys (PF keys), include the default settings for the PF keys, and explain how to modify their functions.
Chapter 2. Preparing to customize DB2 Utilities Solution Pack

Before you start to customize DB2 Utilities Solution Pack, determine all of the customization values that you need to specify during the customization process, and familiarize yourself with all of the customization tasks.

The following checklist lists and describes each significant customization step. Use this checklist to guide you through the entire customization process.

**Tip:** Print the following checklist and the data set names and parameter values worksheets. Use the worksheets to record your values, and refer to them during the customization process.

### Environment setup

Use the information in this section to set up your environment for the DB2 Utilities Solution Pack.

**DB2 Utilities Solution Pack: Set up your environment prior to customization**

Prior to beginning the customization process, ensure that your environment meets all requirements, that you have installed all prerequisite software, and that you have considered how you want to customize optional features.

**Verify that your environment meets software requirements**

Ensure that you are using z/OS V1.12 (5694-A01) or later.

IBM System Modification Program Extended (SMP/E) for z/OS, V3.5 or higher (5655-G44)

Ensure that you are using one of the following supported versions of DB2 for z/OS:

<table>
<thead>
<tr>

</table>
Verify that DB2 Utilities Solution Pack has been installed successfully

See the Program Directory for IBM DB2 Utilities Solution Pack for z/OS, GC19-4931 for installation instructions.

Verify that Tools Customizer has been installed successfully

Tools Customizer for z/OS is a component of IBM Tools Base for z/OS (5655-V93), which is available free of charge. Tools Customizer for z/OS provides a standard approach to customizing IBM DB2 for z/OS Tools.

See the Program Directory for IBM Tools Base for z/OS, GI10-8819 for installation instructions.

Set up your environment prior to customization

Prior to beginning the customization process, ensure that your environment meets all requirements, that you have installed all prerequisite software, and that you have considered how you want to customize optional features.

Verify that your environment meets software requirements

DB2 Automation Tool supports the following versions of DB2 for z/OS:

- DB2 V10
- DB2 Version 11

Additional feature requirements are as follows:

- If you plan to use DB2 Automation Tool with Autonomics Director, DB2 V10 NFM or later is required.
- If you plan to use DB2 Automation Tool’s interface to the DB2 administrative task scheduler:
  - The DB2 subsystems must be configured to enable DB2 administrative task scheduler capabilities.
  - RACF® must be configured to allow PassTickets for the DB2 administrative task scheduler task.
- If you plan to use DB2 Automation Tool’s autonomic statistics functionality, the following DB2 stored procedures must also be configured, and users’ authorization IDs must have execute authority on them:
  - ADMIN_UTL_EXECUTE
  - ADMIN_UTL_MONITOR
- If you plan to use DB2 Automation Tool to build utility JCL for image copies of objects on IBM ESS devices, you must have IBM Enterprise Storage Server® devices with Advanced Copy Services, and the DFSSMS system data mover (SDM) API (macro ANTRQST) must be at level 5 or above.
If you plan to use DB2 Automation Tool to make image copies from DB2 Recovery Expert system level backups (SLBs), you must have DB2 Recovery Expert V2.2 with APAR PM06332 or higher installed on the subsystem.

**Verify that DB2 Automation Tool has been installed successfully**

See the Program Directory for IBM DB2 Automation Tool for z/OS, GI10-8911-01, for installation instructions.

**Verify that Tools Customizer has been installed successfully**

Tools Customizer is a component of IBM Tools Base for z/OS (5655-V93), which is available free of charge. Tools Customizer provides a standard approach to customizing IBM DB2 for z/OS Tools.

See the Program Directory for IBM Tools Base for z/OS, GI10-8819-05 for installation instructions.

**Verify that your environment meets security requirements**

DB2 Automation Tool requires no extra security measures outside of standard DB2 security.

If your site uses ACF2 to restrict TSO command use, you may need to add the TSO commands that DB2 Automation Tool uses to the ACF2 Command Limiting table. The TSO commands that DB2 Automation Tool uses are: HAA$MAIN, HAA@BUILD, and FECDBCX.

**Authorize the FEC$TSOC program**

Add the program FEC$TSOC to the AUTHPGM and AUTHTSF sections of member IKJTSO00 in SYS1.PARMLIB.

**Set the MEMLIMIT parameter**

DB2 Automation Tool utilizes above the bar storage (storage above the 2-gigabyte bar). To control the amount of real and auxiliary storage that an address space can use for memory objects at one time, your site may have established an installation default MEMLIMIT that sets the total number of usable virtual pages above the bar for a single address space. If the default is not sufficient, DB2 Automation Tool cannot be started.

The current default for MEMLIMIT for z/OS V1R10.0 and later is 2G. The default for z/OS versions prior to that is 0, meaning that no address space can use virtual storage above the bar. You should verify that the MEMLIMIT setting for your site is at least 2G for DB2 Automation Tool. This amount is recommended for scalability of a wide range of objects. DB2 Automation Tool only uses as much storage above the bar as it needs, and only as long as it is needed; the storage is released immediately after a job or process is complete.

To set the MEMLIMIT parameter, use one of the following methods:

- Set an installation default on the MEMLIMIT parameter in the SMFPRMxx PARMLIB member.
- Issue the SET SMF or SETSMF command.
Add either the MEMLIMIT parameter or REGION=0 to the logon procedure TSO JCL or the job JCL.

Specify MEMLIMIT in a IEFUSI exit routine; if you do so, this MEMLIMIT setting overrides all other MEMLIMIT settings.

The following example shows the MEMLIMIT parameter added to a TSO logon procedure:

```
//TSOPROC EXEC PGM=IKJEFT01,REGION=0M,DYNAMNBR=175,
// PARM='%LOGINIT',TIME=1440,MEMLIMIT=2G
```

See the IBM z/OS documentation for your version of z/OS for additional information about MEMLIMIT.

**Add the IEFACTRT exit to the SMFPRMxx member of SYS1.PARMLIB**

The IEFACTRT exit is required for successful operation of the execution reports facility. If the exit is not currently defined, add the IEFACTRT exit at either the SYS or SUBSYS level to the appropriate JES subsystem in the SMFPRMxx member of your site’s SYS1.PARMLIB.

The HAAPROC member checks for IEFACTRT at the SUBSYS.JES level or SYS level upon startup. If the IEFACTRT entry is not found, DB2 Automation Tool job tracking will not work. If the IEFACTRT entry is found, the CSVDYNEX service will dynamically define the exit for DB2 Automation Tool job tracking.

In addition, ensure that type 30 SMF records are included in the SMF record types specified in SMFPRMxx.

**Create an active WLM environment for integration with Autonomics Director**

To use DB2 Automation Tool with Autonomics Director, the Autonomics Director stored procedures that are created during customization must be associated with an active Workload Manager (WLM) environment. You can do this by using one of the following methods:

- When customizing DB2 Automation Tool using Tools Customizer, select the Management Console Stored Procedures optional task and run the generated JCL.
- Adapt an existing WLM PROC already active for your DB2 subsystem.

Each DB2 environment (SSID or data sharing group) must have separate PROCs and separate WLM environments.

The WLM PROC must be activated using the WLM panels. This is generally done by a systems programmer. When activating the WLM environment for use with DB2 Automation Tool, the following settings are required:

**Application Environment Name**

Enter the WLM ENVIRONMENT parameter in the DDL that defines the stored procedure(s).

**Description**

(Optional) Enter a description.

**Subsystem Type**

Must be set to DB2.
**Procedure Name**
Enter the name of the JCL PROC that defines the address space in which the stored procedure runs.

**Start parameters**
Required parameters are:
- `DB2SSN=ssid`
- `APPLENV=applenv_name`

Optional parameter:
- `NUMTCB=number`

`applenv_name` must be the same value that was entered in the Application Environment Name field.

NUMTCB can be left unspecified and specified in the JCL PROC. The sample PROC provided handles the NUMTCB parameter in the PROC. If specified on the WLM panel, the panel specification takes precedence over the JCL PROC parameter.

Take into account the following considerations:

- Use the same name for the application environment name and the JCL PROC.
- Adopt a naming convention for the application environment name that includes the SSID as part of the name, such as `ssidxxxx` or `xxxxsid`. For example, for two WLM environments that are associated with Autonomics Director (DYX) on DB2 subsystem ID DB2A, then possible application environment and procedure names might be DB2ADYX1 and DB2ADYX2, respectively.

If you choose to adapt an existing WLM PROC to run the Autonomics Director stored procedures, the PROC must include the DB2 Automation Tool load library, the FEC load library, and the Autonomics Director load library. Additionally, the PROC must have a DD named `DB2PARMS` that points to the DB2 Automation Tool control file.

**Apply maintenance before migrating from DB2 Automation Tool V3.1 or V4.1**

If you are upgrading from DB2 Automation Tool V3.1 or V4.1, and you plan to migrate your V3.1 or V4.1 data repository to use with DB2 Automation Tool V4.2, ensure that all current maintenance has been applied to DB2 Automation Tool V3.1 or V4.1 before beginning the customization process.

**DB2 Automation Tool version compatibility**

**Restriction:** DB2 Automation Tool V3.1 and DB2 Automation Tool V4.2 can be installed on the same LPAR. However, a single TSO user ID cannot run V3.1 and V4.2 at the same time. Unpredictable results may occur.

**Hardware and software requirements**

DB2 HPU requires the same hardware configuration that is required by DB2 for z/OS Version 10 or later.

DB2 HPU requires the following software:
- z/OS Version 1 Release 13 or later
- DB2 Version 10.1 for z/OS or later
Note:

To exploit DB2 10 for z/OS functionality, DB2 HPU V4.2 with appropriate maintenance level (PM78638 for Toleration and PM91909 for exploitation) is required. Previous versions of DB2 HPU cannot exploit DB2 10 for z/OS functionality.

If you want to perform conversions that imply non-SBCS CCSIDs or pairs of SBCS CCSIDs that are not supported by the SYSSTRINGS catalog table, you must install z/OS Support for Unicode.

Set up your environment prior to customization

Prior to beginning the customization process, ensure that your environment meets all requirements, that you have installed all prerequisite software, and that you have considered how you want to customize optional features.

Verify that your environment meets hardware requirements

DB2 Utilities Enhancement Tool can be used on any IBM mainframe computer that is capable of running the required software.

Verify that your environment meets software requirements

Ensure that you are using z/OS V1.11 (5694-A01) or later.

Ensure that you are using one of the following versions of DB2 for z/OS:
- DB2 V8 (5625-DB2) (new function mode). Additionally, make sure that DB2 V8 maintenance has been applied.
- DB2 Value Unit Edition V8.1 (5697-N29)
- DB2 V9 (5635-DB2). Additionally, make sure that DB2 V9 maintenance has been applied.
- DB2 Value Unit Edition V9.1 (5697-P12)
- DB2 V10 (5605-DB2). Additionally, make sure that DB2 V10 APAR PM93789 has been applied.
- DB2 Value Unit Edition V10.1 (5697-P31)

Note: This is the minimum version that supports the following DB2 UET features for LOAD processing:
- SHRLEVEL REFERENCE option
- IFDISCARDS option
- DB2 V11 (5615-DB2)
- DB2 Value Unit Edition V11.1 (5697-P43)

Ensure that you are using a supported version of the following software:
- ISPF V4 (5655-042) or later
- IBM SMP/E for z/OS V03.05.00 (5655-G44) or later
- DB2 Utilities Suite for z/OS V10.01.00 (5655-V41) or later
- IBM Tools Base for z/OS V01.02.00 (5655-V93) or later

(HPU users only) To substitute the IBM DB2 High Performance Unload for z/OS (HPU) for the DB2 UNLOAD utility, HPU must be installed on the DB2 subsystem on which the UNLOAD is to be executed.
To use features that prevalidate data before loading it (IFDISCARDS and SHRLEVEL REFERENCE options):

- Ensure that your IBM Workload Manager for z/OS (WLM) environment is set up so that DB2 UET can run the SYSPROC.DSNUTILU stored procedure.
- If the DB2 UET load modules are in the WLM STEPLIB concatenation, or if the DB2 Analytics Accelerator Loader product is installed, ensure that DB2 UET APAR PI04864 is applied and that you are using the modules that are provided with it. Specifically, verify that the compile date in the DSNUTILF module in the WLM address space is the same as the date of the module in the enhancement load library.

**Verify that your environment meets storage requirements**

For each z/OS system on which DB2 UET will run, ensure that the common service area (CSA) or extended common service area (ECSA) meets the minimum storage requirements, that your DFSMS rules support the LOAD utility enhancements, and that your DASD storage is sufficient.

- The CSA and ECSA storage requirements are as follows. The total amount of CSA/ECSA storage that is required will depend on the number of started tasks that you run, the number of users, the level of user request activity, and the number of DB2 subsystems that are defined on the z/OS system.
  - 4 KB from subpool 228 in ECSA for the vector table
  - 1 KB from subpool 241 in CSA or ECSA for each active DB2 UET started task
  - 160 bytes from subpool 241 in CSA or ECSA for each simultaneous request that is made from a DB2 UET interface
  - 44 bytes from subpool 241 in CSA or ECSA for each DB2 subsystem that is defined on the z/OS system
  - DB2 UET supports the date, time, and timestamp values of the IBM DB2 High Performance Unload for z/OS (HPU) product. To use this feature, a minimum amount of storage will be required in CSA/ECSA. All other storage is allocated from private address spaces or data spaces.

- DFSMSdss requirements are as follows:
  When performing data prevalidation for the DB2 LOAD utility and when running the LOAD utility with the parameters REPLACE SHRLEVEL REFERENCE, DB2 UET uses DFSMSdss to copy data sets from the production objects to the shadow objects. If SMS is active, you must set up SMS rules to allow the shadow data sets to reside on volumes that are allowed for DB2 objects. The underlying data sets for the shadow objects will be renamed to become the active page set for the DB2 table and index spaces; they will not be moved from the location in which SMS places them when the shadow objects are created.

  The renaming or DFSMSdss COPY of DB2 VSAM objects follows the standard naming conventions for such objects:

  \[\text{catname}.\text{DSNDB}x.\text{dbname}.\text{psname}.y0001.znnn\]

  where \(y\) is a letter in the range A through Z. DB2 UET checks for existing data set names and uses the first available letter to rename the objects.

- For DASD storage requirements, see the Program Directory for DB2 UET for z/OS.
Verify that DB2 Utilities Enhancement Tool has been installed successfully

See the Program Directory for IBM DB2 Utilities Enhancement Tool for z/OS, GI10-8981 for installation instructions.

Verify that Tools Customizer has been installed successfully

Tools Customizer is a component of IBM Tools Base for z/OS (5655-V93), which is available free of charge. Tools Customizer provides a standard approach to customizing IBM DB2 for z/OS Tools.

See the Program Directory for IBM Tools Base for z/OS, GI10-8819 for installation instructions.

Deployment considerations

Some components of the DB2 Utilities Solution Pack have deployment issues that you should consider before you customize them.

Deployment considerations: DB2 Automation Tool

Before you customize DB2 Automation Tool, determine whether a DB2 subsystem that is being used with DB2 Automation Tool was migrated to a later version, or must be reverted to a prior version.

DB2 version migration and fallback

When a DB2 subsystem that is being used with DB2 Automation Tool is migrated to a later version, or must be reverted to a prior version, follow these steps.

After your subsystem has been migrated to a later version of DB2, you can port your repository statistics to the new subsystem. For example, you can port the statistics repository from a DB2 V9 subsystem to a DB2 V10 subsystem. Information about migration is also provided in this topic.

DB2 version migration and fallback instructions

These steps must be performed when a DB2 subsystem that has been customized for use with DB2 Automation Tool is migrated to a later DB2 version, or must be reverted to a previous DB2 version.

About this task

For member names described in this procedure, ss is a job sequence number and dd is a set of alphanumeric characters assigned by Tools Customizer. Refer to “Worksheets: Gathering required data set names” on page 37 for additional information.

Procedure

1. Start Tools Customizer.
2. Run the Discover command to ensure that the Tools Customizer datastore is up to date.
3. For each DB2 subsystem that has been customized:
   a. On the Customizer Workplace panel, edit the DB2 entry.
b. On the DB2 Parameters panel, change the Mode and Level number fields to the new DB2 mode and level. Change other DB2 specific fields, such as library or BSDS names, as required. Save and exit the DB2 Parameters panel.

c. On the Customizer Workplace panel, regenerate the customization jobs for the subsystem.

d. Submit the SSID-specific update control file job (member name ssCF2dd).

e. For DB2 migrations only, submit jobs to update the repository (member name ssDD*dd). Skip this step for fallback.

f. For fallback only, submit the job to free previously bound plans and packages from the fallback subsystem (member name ssFREEdd).

g. Submit the bind job (member name ss#BNDdd).

Porting repository statistics from one DB2 subsystem to another
You can use the HAARSTAT job that is provided in SHAASAMP to unload DB2 Automation Tool repository RUNSTATS statistics from one DB2 subsystem and load another DB2 subsystem with the statistics.

About this task
You can also use this job to migrate statistics between DB2 versions; for example, you can migrate the statistics repository from a DB2 V9 subsystem to a DB2 V10 subsystem.

Procedure
Edit and run the HAARSTAT sample job; the instructions are contained in the member. Information about the number of unloaded repository RUNSTATS statistics rows is displayed during the unload phase. Information is also provided about the number of RUNSTATS statistics rows that are loaded during the load phase.

Deployment considerations: DB2 Sort
Before you customize DB2 Sort, understand the default installation options and runtime considerations.

Default installation options
The DB2 Sort default installation options include options for dynamic sort work allocation, optimization mode, sensitivity to paging activity, and tuning messages.

Dynamic sort work allocation options
The following options refer to values used for the dynamic allocation of sort work data sets. These data sets are de-allocated when the sort process has completed.

Sort work DASD pool
This value specifies the 1- to 8-character name of the group of devices from which DB2 Sort dynamically allocates the sort work data sets if SMS is not installed or active for temporary DASD work data sets. If SMS is active, you can specify a value for the sort work storage class option. The default value is SYSDA.

Restriction: You cannot specify VIO as a unit device.

Note: This value can be overridden at run time.
Sort work DASD type

This value specifies the type of DASD with the smallest track capacity that might be encountered at your installation by a dynamically allocated sort work data set. If, during dynamic allocation, DB2 Sort receives a device with a track capacity that is smaller than the one specified, it might ignore the specified device type. The default value is 3390.

The following table lists common DASD types and their track capacities:

<table>
<thead>
<tr>
<th>DASD type</th>
<th>DASD track capacity</th>
</tr>
</thead>
<tbody>
<tr>
<td>3380</td>
<td>47476</td>
</tr>
<tr>
<td>3390</td>
<td>56664</td>
</tr>
<tr>
<td>9345</td>
<td>46456</td>
</tr>
</tbody>
</table>

Number of allocation retry attempts

This value specifies the number of times that DB2 Sort automatically retries a dynamic allocation request in situations where sufficient disk space is not immediately available to satisfy that request. Insufficient disk space can result in a Sort Capacity Exceeded condition. The minimum value allowed is 0 and the maximum value is 16. The default value is 5.

Minutes between retry attempts

This value specifies the number of minutes to wait between dynamic allocation retry attempts. The minimum value allowed is 0 and the maximum value is 15. The default value is 3.

Sort work storage class

This value specifies the storage class that DB2 Sort uses to manage temporary work data sets for the dynamic allocation of sort work data sets if SMS is active. If this value is not specified in an SMS environment, DB2 Sort dynamically allocates devices from the generic class name that is specified for the sort work DASD pool. There is no default value for storage class.

Note: An installation-written automatic class selection (ACS) routine can override the value you specify.

Maximum number of sort works

This value specifies the maximum number of sort work data sets that can be used. DB2 Sort can dynamically allocate data sets to bring the total number of sort work data sets up to the number that you specify. Specify a value from 32 through 255. DB2 Sort automatically determines the appropriate number of sort work files to use. The default value is 32.

Note: This value can be overridden at run time.

Optimization mode option

This value specifies the optimization mode for DB2 Sort.

OPTMODE

BALANCE

BALANCE provides the best mix of CPU and elapsed time performance by balancing utilization of central storage and disk space. Typically BALANCE uses less CPU time and more elapsed time than ELAP.
CPU optimizes to minimize CPU time without any consideration for elapsed time, maximizing disk space usage.

ELAP optimizes to minimize elapsed time while significantly reducing CPU time, favoring central storage over disk space usage. The default value is ELAP.

Note 1: All of these options limit central storage use if auxiliary storage availability is low.

Note 2: The OPTMODE value can be overridden at run time.

Sensitivity to paging activity option

This value specifies the type of storage allocations that DB2 Sort chooses.

PAGEMON

ON Choose 0N only if your system is highly sensitive to paging activity.

OFF Choose 0FF if you use the defaults for DFSORT's DSPSIZE, HIPRMAX and MOSIZE installation options. The default value is 0FF.

Note: Elapsed time may increase if PAGEMON is set to ON.

Tuning messages option

This value specifies whether DB2 Sort displays additional informational messages for tuning purposes. These tuning messages provide information about the product's resource utilization, such as memory usage, sort work DASD space, and sort work EXCPs.

TUNEMSG

ON Enables the generation of the additional tuning messages. The default value is ON.

OFF Suppresses the additional tuning messages.

Note: The TUNEMSG value can be overridden at run time.

Runtime considerations

To improve performance, you might want to modify the REGION parameter in your DB2 utility job step. You can also override some of the installation options at run time.

The REGION parameter

Because DB2 Sort manages memory allocation dynamically, setting REGION=0M is recommended for best performance.

Default installation options that you can override at run time

Although most applications can use the default installation options, some applications might require different options. You can override installation options at run time by passing parameters in the DB2SORTI DD data set.

Important: This data set must have a fixed-length format with 80-byte records.
You can specify the `DYNALLOC`, `OPTMODE`, and `TUNEMSG` parameters at run time.

The parameters can start in any column but must be completed on the current record.

**DYNALLOC**

This parameter specifies values for dynamic sort work allocation.

**Syntax**

```plaintext
DYNALLOC = cccccccc
     (ccccccc)
     (nnn)
     (ccccccc,nnn)
```

**Options**

- `ccccccc`:
  This value specifies the 1- to 8-character name of the group of devices from which DB2 Sort dynamically allocates the sort work data sets. This value can be omitted. If the value is omitted, specify a comma before the `nnn` value.

  **Restriction:** You cannot specify VIO as a unit device.

- `nnn`:
  This value specifies the maximum number of sort work files that can be used. DB2 Sort can dynamically allocate data sets to bring the total number of sort work data sets up to `nnn`. Specify a value from 32 through 255. DB2 Sort automatically determines the appropriate number of sort work files to use.

**OPTMODE**

This value specifies the optimization mode for DB2 Sort.

**Syntax**

```plaintext
OPTMODE = BALANCE
         CPU
         ELAP
```

**Options**

- `BALANCE`:
  BALANCE provides the best mix of CPU and elapsed time performance by balancing utilization of central storage and disk space. Typically BALANCE uses less CPU time and more elapsed time than ELAP.

- `CPU`:
  CPU optimizes to minimize CPU time without any consideration for elapsed time, maximizing disk space usage.

- `ELAP`:
  ELAP optimizes to minimize elapsed time while significantly reducing CPU time, favoring central storage over disk space usage.

**Note:** All of these options limit central storage use if auxiliary storage availability is low.
TUNEMSG

This parameter specifies whether DB2 Sort will display additional informational messages for tuning purposes. These tuning messages provide information about the product's resource utilization, such as memory usage, sort work DASD space, and sort work EXCPs.

Syntax

```
ON
OFF
```

Options

- **ON**: Enables the generation of the additional tuning messages.
- **OFF**: Suppresses the additional tuning messages.

Example

```sql
//DB2SORTI DD *
DYNALLOC=(,50),OPTMODE=ELAP
```

This example of a runtime override accomplishes the following goals:

- Specifies 50 for the maximum number of sort work data sets that can be used
- Sets the optimization mode to ELAP

**Deployment considerations: DB2 Utilities Enhancement Tool**

Before you customize DB2 Utilities Enhancement Tool, understand the following deployment considerations.

**Storage requirements**

For each z/OS system on which DB2 UET will run, ensure that the common service area (CSA) or extended common service area (ECSA) meets the minimum storage requirements. Also, ensure that your DASD storage is sufficient.

The CSA and ECSA storage requirements are as follows:

- 4 KB from subpool 228 in ECSA for the vector table
- 1 KB from subpool 241 in CSA or ECSA for each active DB2 UET started task
- 160 bytes from subpool 241 in CSA or ECSA for each simultaneous request that is made from a DB2 UET interface
- 44 bytes from subpool 241 in CSA or ECSA for each DB2 subsystem that is defined on the z/OS system
- The DB2 UET supports the date, time, and timestamp values of the IBM DB2 High PerformanceUnload for z/OS (HPU) product. To use this enhancement, a minimum amount of storage will be required in CSA/ECSA. All other storage is allocated from private address spaces or data spaces.

The total amount of CSA/ECSA storage that is required will depend on the number of started tasks that you run, the number of users, the level of user request activity, and the number of DB2 subsystems that are defined on the z/OS system.

For DASD storage requirements, see the Program Directory for DB2 UET for z/OS.
Deployment in a DB2 data sharing environment

If you plan to deploy DB2 UET in a DB2 data sharing environment, review this information to learn about deployment and configuration issues.

A DB2 data sharing group is composed of one or more DB2 subsystems that are located on the same z/OS image or on different z/OS images. The member subsystems share a common DB2 catalog and can directly access and change the same data while maintaining data integrity.

A DB2 UET started task can block and cancel threads and perform DSNUTILB intercept processing on the active subsystems within a data sharing group that have a DB2 version that DB2 UET supports. At least one of the member subsystems must be defined as the primary subsystem during customization and must contain the DB2 UET audit and logging tables. Because all subsystems in a data sharing group share the same DB2 catalog, they can also share the same thread-blocker and DSNUTILB-intercept tables and (for the REORG TABLESPACE mapping-table enhancement) the same mapping-table database and table space. You can define these objects once on any active member subsystem in the data sharing group. If you define these objects on a subsystem other than the primary subsystem, you will also need to define that subsystem as an additional subsystem during customization.

For the started task to communicate with the subsystems in a data sharing group, you must set the DB2\_CONNECT\_TO\_ALL\_SUBSYSTEMS initialization option for the started task to "Yes." If you specify "No" instead, the started task will be able to connect only to the subsystem that is specified in the DB2\_SSID initialization option (that is, the primary subsystem).

Additional requirements, considerations, and restrictions depend on the DB2 UET interface that you use.

If you plan to use the DSNUTILB intercept, ensure that these requirements and recommendations are met:

- A DB2 UET started task must be running on each z/OS image where a member subsystem of the data sharing group is located. If some member subsystems are on a remote z/OS image, a started task configuration must be running on the remote z/OS image as well as on the z/OS image where the primary subsystem is located. Each started task must have its own set of DB2 objects and plans for DB2 UET. When you run the Tools Customizer for an additional started task configuration on a remote z/OS image, ensure that the field The DB2 UET primary subsystem on the Product Parameters panel contains the name of the DB2 SSID to use as the primary subsystem on the remote z/OS image.
- Each member subsystem must be specified in the DSNUTILB intercept policy for the local started task by using the <DB2SYSTEM> element.
- If the member subsystems are on different z/OS images, it is recommended that you associate the same intercept policy with the started task configuration on each of these z/OS images so that the same intercept policy will be used for all members of the data sharing group.

If you plan to use the ISPF interface or batch interface, only one started task configuration and one intercept policy are required, even if the member subsystems are on different z/OS images. All members of the data sharing group
will share a common set of DB2 objects for DB2 UET: the audit and logging tables on the primary subsystem, and the thread-blocker table, DSNUTILB-intercept worklist tables, and mapping-table database and table space on any active subsystem in the data sharing group. You will be able to cancel threads on any active subsystem that is within the same data sharing group as the primary subsystem. However, the following restrictions apply:

- You cannot perform escalated cancelations of DB2 threads on any member subsystems that are located on a z/OS image other than the z/OS image where the primary subsystem is located.
- For batch thread-cancelation operations that include thread blocking, you cannot perform the job step for blocking and canceling threads on a member subsystem that is on one z/OS image and then perform the job step for allowing new threads on another member subsystem that is on a different z/OS image. That is, the BLOCK_THREADS and ALLOW_THREADS actions must apply to the same member subsystem on one z/OS image.

The following figure shows a sample product configuration in a data sharing environment:

---

Figure 1. Sample product configuration in a DB2 data sharing environment

The DB2 subsystems DBQ, DBR, and DBS comprise a data sharing group that spans two z/OS images. DBQ is the primary DB2 subsystem for the DB2 UET started task configuration. It contains the audit and logging tables that are used for all started task operations, including those that involve the non-data sharing
subsystem DBP. DBQ also contains the thread-blocker and DSNUTILB-intercept tables; these tables are shared by all subsystems in the data sharing group. If you use the ISPF or batch interface, you could cancel threads on the DBP subsystem and on each subsystem in the data sharing group (DBQ, DBR, and DBS). However, if you use the DSNUTILB intercept, you could perform intercept processing (thread cancelation, or the utility-specific enhancements) only on the DBP and DBQ subsystems. To perform intercept processing on the DBR and DBS subsystems, another started task configuration would need to be running on z/OS image 2. Also, the intercept policy for that started task configuration would need to specify the DBR and DBS subsystems.

**Started task authorization requirements**

Make sure that the DB2 UET started task will run under a user ID that has the proper authority. The started task must run under a user ID that has SYSADM or SYSCTRL privileges. If you want to control security at the user level, you must create a security exit.

If you want to control access to thread-management functions or ISPF panels at the user level, you can create an optional security exit in assembler language. For example, you could create a security exit to control which users can perform thread cancelations and access the product administration panels. A sample security exit (ABPXSE00) and corresponding DSECT (ABPAPISE) are available in the hlq.mlq.SABPSAMP library, where hlq is the high-level qualifier and mlq is the mid-level qualifier that you specify during customization. You will need to specify the name of your security exit in the started task initialization options member by using the SECURITY_EXIT option. If you do not create a security exit, all users will be able to access all product functions.

**Considerations for running multiple started tasks**

A single started task is usually sufficient to handle multiple user requests from any of the DB2 UET interfaces to perform work on one or more DB2 subsystems. However, if you have a very high volume of activity, you can run multiple started tasks concurrently to handle the workload more efficiently.

If you run multiple concurrent started tasks, the SABPSAMP library must contain a separate started task initialization options member for each started task. Each initialization options member must specify a unique SVC number.

Also, each started task should have its own set of DB2 UET audit, logging, DSNUTILB-intercept, and thread-blocker tables. Although it is possible to share these tables across started tasks (because each row in each table is qualified by the abpid value for the started task configuration), this practice is not recommended. When multiple started tasks use the same tables, a very large volume of data might be written to the tables.

You will need to run the Tools Customizer for each started task to generate the following items: the DDL for creating the DB2 objects that the started task will use, the statements for binding the DB2 plan and packages on the DB2 subsystems that the started task will communicate with, the sample started task PROC, the started task initialization options member, and the sample DSNUTILB intercept policy. A separate DSNUTILB intercept policy is not required for each started task; the same intercept policy can be used by multiple started tasks if appropriate.

**Tip:** If you want to prevent a started task from performing work on a particular DB2 subsystem, you can *not* bind the plan and packages for the started task on that subsystem.
After you set up the started tasks, you can select the one that you want to use for performing product functions, as follows:

- In the ISPF interface, select a started task configuration ID on the Set ABPID panel.
- In a batch thread-cancelation job, specify a started task configuration ID by using the ABPID parameter.
- If you are using the DSNUTILB intercept, ensure that the ABPPLCY DD statement in the started task PROC specifies the DSNUTILB intercept policy that you want to use for performing intercept processing with that started task.

The following additional considerations apply if you are using the DSNUTILB intercept:

- A single started task can connect to multiple DB2 subsystems to perform intercept processing. You specify the subsystems in the DSNUTILB intercept policy for a started task by using the &DB2SYSTEM& element. However, any given DB2 subsystem can be intercepted by only one started task at a time.
- You can run multiple started tasks to perform intercept processing on different DB2 subsystems. You must specify a DSNUTILB intercept policy for each started task. If more than one started task policy identifies the same DB2 subsystem (either by specifying the same SSID or a wildcard pattern), the started task that connects to that subsystem first will have exclusive use of the subsystem until intercept processing completes. No other DB2 UET started task will be able access the subsystem while the first started task is performing intercept processing.

The following figure shows two DB2 UET started tasks performing DSNUTILB intercept processing for three subsystems:
The DSNUTILB intercept policy for started task 1 specifies the DB2 subsystems DBM and DBN. The policy for started task 2 specifies the DB2 subsystems DBN and DBO. Because started task 1 initializes first, it intercepts DBN before started task 2. Started task 2 cannot intercept DBN until after started task 1 completes its intercept processing on DBN.

**Dispatching priority**

Ensure that the dispatching priority for the DB2 UET task is set correctly with respect to other dispatching priorities. The dispatching priority determines the order in which a task can use the processor in a multitasking environment.

The DB2 UET dispatching priority must be lower than the priority values for the DB2 subsystems that DB2 UET will use but higher than the priority values for any utilities or batch jobs for which DB2 UET will perform processing. Set the dispatching priorities for these items in the following order (from highest to lowest priority):

1. The address spaces of the DB2 subsystems that DB2 UET will use (highest dispatching priority)
2. The DB2 UET started task
3. The DB2 utilities, batch jobs, and applications for which DB2 UET performs a function such as thread cancelation (any dispatching priority under the DB2 UET started task)

**Use of WTO messages for automated operations**

Consider whether you want to use the Write-to-Operator (WTO) messages that DB2 UET issues for automated operations.
DB2 UET issues some messages as WTO messages in addition to printing them to the SYSPRINT data set. If your automation tools can process WTO messages, you can use these messages to control the flow of automated operations in your environment.

The following WTO messages on the status of the DB2 UET started task are particularly useful: ABPS0001I, ABPS0002I, ABPS0003I, and ABPS0004I. These messages report the beginning and end of the started task initialization and termination phases.

**Operational issue related to the vector table**

Consider this operational issue regarding the common vector table.

Some IBM products for z/OS systems, including DB2 UET, share a 4-KB vector table that resides in ECSA (subpool 228, storage key 0). This table, called the RVT, serves as an anchor point for these products. The first product to start after an IPL will obtain and initialize the RVT. If that product subsequently terminates, the RVT storage is deliberately not released because it could be serving multiple products. A system-monitoring product might report the RVT storage as "orphaned" or "owner gone." In this situation, do not attempt to release the RVT storage. If you do so, the other products that are using the vector table can be severely damaged.

**If you are migrating from DB2 Thread Expert**

DB2 UET incorporates all of the features of the previously released product IBM DB2 Thread Expert for z/OS V1R1. It also provides additional features that enhance the DB2 online utilities. If you are migrating from DB2 Thread Expert to DB2 UET, review these migration requirements.

You can run both DB2 Thread Expert V1R1 and DB2 UET V2R1 on your z/OS system. This practice enables you to continue to use DB2 Thread Expert until you are ready to switch entirely to DB2 UET.

To run both products, ensure that the following requirements are met:

- Install DB2 UET in an SMP/E zone that different from the SMP/E zone in which DB2 Thread Expert is installed.
- Apply APAR PK48293 for DB2 Thread Expert V1R1. This APAR prevents the DB2 Thread Expert batch or ISPF interface from attempting to connect to the DB2 UET started task, thereby causing errors. You can obtain the APAR from the following Web page: http://www-306.ibm.com/software/data/db2imstools/support.html.
- Ensure that each product has its own DB2 plan and own set of DB2 objects (database, table spaces, and tables). DB2 Thread Expert and DB2 UET can not share the same DB2 plan and objects or use the same database name or creator ID for the DB2 objects. Note that if you want to use the same database name or creator ID, you can not run both products on your system; you would need to drop the existing DB2 Thread Expert database and objects during DB2 UET customization.
- Ensure that the following fields are not used in the DB2 UET DSECT (ABPAPIPR) for the pre-cancel exit: UXPR_ACE_TOKEN, UXPR_FTDD_TOKEN, and UXPR_STATUS_FLAGS. These fields were included in the DB2 Thread Expert sample DSECT for this exit but they have been deprecated.
- Ensure that the following fields are not used in the DB2 UET DSECT (ABPAPIPO) for the post-cancel exit: UXPO_ACE_TOKEN,
UXPO_FTDD_TOKEN, and UXPO_STATUS_FLAGS. These fields were included in the DB2 Thread Expert sample DSECT for this exit but they have been deprecated.

Worksheets: Data set names and parameters
Complete the following worksheets before you begin the customization process.

Worksheets: DB2 Utilities Solution Pack
Complete the following worksheets before you begin the customization process.

Worksheets: Gathering required data set names
Identify and record the data set names that will be used during the customization process and make sure that requirements for certain data sets are met.

Data set names for Tools Customizer
Identify and record the following Tools Customizer data set names:

<table>
<thead>
<tr>
<th>Data set name</th>
<th>Description</th>
<th>Special requirements</th>
<th>Your data set name</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCCQEXEC</td>
<td>EXEC library for Tools Customizer</td>
<td>None.</td>
<td></td>
</tr>
<tr>
<td>SCCQDENU</td>
<td>Metadata library for Tools Customizer</td>
<td>None.</td>
<td></td>
</tr>
<tr>
<td>SCCQLOAD</td>
<td>Executable load module library for Tools Customizer</td>
<td>None.</td>
<td></td>
</tr>
<tr>
<td>SCCQMENU</td>
<td>ISPF messages for Tools Customizer</td>
<td>None.</td>
<td></td>
</tr>
<tr>
<td>SCCQPENU</td>
<td>ISPF panels for Tools Customizer</td>
<td>None.</td>
<td></td>
</tr>
<tr>
<td>SCCQSAMP</td>
<td>Sample members for Tools Customizer</td>
<td>None.</td>
<td></td>
</tr>
<tr>
<td>SCCQTENU</td>
<td>Table library for Tools Customizer</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Data set names of DB2 Utilities Solution Pack
Identify and record the following DB2 Utilities Solution Pack data set names. During the customization process, you will enter the following values on panel CCQPPRD.

<table>
<thead>
<tr>
<th>Data set name</th>
<th>Description</th>
<th>Special requirements</th>
<th>Your data set name</th>
</tr>
</thead>
<tbody>
<tr>
<td>SBBYDENU</td>
<td>Metadata library for DB2 Utilities Solution Pack</td>
<td>None.</td>
<td></td>
</tr>
</tbody>
</table>

Worksheets: DB2 Automation Tool
Complete the following worksheets before you begin the customization process.

Worksheets: Gathering required data set names
Identify and record the data set names that will be used during the customization process and make sure that requirements for certain data sets are met.
### Data set names for Tools Customizer

Identify and record the following Tools Customizer data set names:

<table>
<thead>
<tr>
<th>Data set name</th>
<th>Description</th>
<th>Special requirements</th>
<th>Your data set name</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCCQDENU</td>
<td>Metadata library for Tools Customizer</td>
<td></td>
<td></td>
</tr>
<tr>
<td>SCCQLOAD</td>
<td>Executable load module library for Tools Customizer</td>
<td></td>
<td></td>
</tr>
<tr>
<td>SCCQMENU</td>
<td>ISPF messages for Tools Customizer</td>
<td></td>
<td></td>
</tr>
<tr>
<td>SCCQPENU</td>
<td>ISPF panels for Tools Customizer</td>
<td></td>
<td></td>
</tr>
<tr>
<td>SCCQSAMP</td>
<td>Sample members for Tools Customizer</td>
<td></td>
<td></td>
</tr>
<tr>
<td>SCCQTENU</td>
<td>Table library for Tools Customizer</td>
<td>You must have write access to this data set.</td>
<td></td>
</tr>
</tbody>
</table>

### Data set names of DB2 Automation Tool

Identify and record the following DB2 Automation Tool data set names. During the customization process, you will enter the following values on panel CCQPPRD.

<table>
<thead>
<tr>
<th>Data set name</th>
<th>Description</th>
<th>Special requirements</th>
<th>Your data set name</th>
</tr>
</thead>
<tbody>
<tr>
<td>SHAADBRM</td>
<td>DBRM library for DB2 Automation Tool</td>
<td></td>
<td></td>
</tr>
<tr>
<td>SHAALOAD</td>
<td>Executable load module library for DB2 Automation Tool</td>
<td>You must APF authorize this data set.</td>
<td></td>
</tr>
<tr>
<td>SHAAMENU</td>
<td>ISPF messages for DB2 Automation Tool</td>
<td></td>
<td></td>
</tr>
<tr>
<td>SHAAPENU</td>
<td>ISPF panels for DB2 Automation Tool</td>
<td></td>
<td></td>
</tr>
<tr>
<td>SHAASAMP</td>
<td>Sample members for DB2 Automation Tool</td>
<td></td>
<td></td>
</tr>
<tr>
<td>SHAADENU</td>
<td>Metadata library for DB2 Automation Tool</td>
<td></td>
<td></td>
</tr>
<tr>
<td>SHAASLIB</td>
<td>ISPF skeleton library for DB2 Automation Tool</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Data set names of FEC (common code)

If the FEC (common code) data sets were installed into their own target libraries and not into the DB2 Automation Tool libraries, identify and record the following FEC data set names. During the customization process, you will enter the following values on panel CCQPPRD.

<table>
<thead>
<tr>
<th>Data set name</th>
<th>Description</th>
<th>Special requirements</th>
<th>Your data set name</th>
</tr>
</thead>
<tbody>
<tr>
<td>SFECDBRM</td>
<td>DBRM library for FEC common code.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Data set names of other libraries

Identify and record the following data set names. During the customization process, you will enter the following values on the Setup panel.

<table>
<thead>
<tr>
<th>Data set name</th>
<th>Description</th>
<th>Special requirements</th>
<th>Your data set name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discover output data set</td>
<td>Contains the output that is generated when you run the DB2 Automation Tool Discover EXEC.</td>
<td>You must have write access to this data set.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The DB2 Automation Tool Discover EXEC retrieves the metadata and values for the parameters from a previous customization of DB2 Automation Tool.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>The default name of the data set is DB2TOOL.CCQ110. DISCOVER. You can change the default value on the Tools Customizer Settings panel or the Discover Customized Product Information panel.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Data store data set</td>
<td>Contains product, LPAR, and DB2 parameter values, and DB2 entry associations. Tools Customizer uses this data set to permanently store all information that is acquired about the product, DB2 subsystems, and LPAR when you customize products on the local LPAR.</td>
<td>You must have write access to this data set.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The default name of the data set is DB2TOOL.CCQ110. DATASTOR. You can change the default value on the Tools Customizer Settings panel.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
## Product customization Library

Contains the customization jobs that Tools Customizer generates for DB2 Automation Tool.

To customize DB2 Automation Tool, submit the members of the data set in the order in which they are displayed on the Finish Product Customization panel. The data set naming convention is:

*hlq.*$LPAR-name$.xyzvrm*

where:

- *hlq* is the value of the Customization library qualifier field on the Tools Customizer Settings panel (CCQPSET)
- *LPAR-name* is the four-character LPAR name
- *xyzvrm* is the three-letter product identifier with the version, release, and modification level

For example, the data set name might be `DB2TOOL.PRODUCT.CUST.$MVS1$.XYZ420`.

You must have write access to this data set.

### Worksheets: Gathering parameter values for DB2 Automation Tool

During the customization process, you need to provide parameter values for DB2 Automation Tool, for DB2, and for your LPAR.

Use the worksheets in this topic to record the appropriate parameter settings for your purposes, and then use these worksheets during the customization process. The worksheets are organized based on the order of the customization panels in the Tools Customizer.

After the customization jobs are generated, they are grouped by the job sequence number. In this topic, the jobs use an 8-character member naming convention that follows the format of *ssjjjjdd*, where:

- *ss* is the job sequence number, which is an alphabetic character (A - Z) followed by a numeric character (0 - 9). For example, a job sequence number is A0, A1, ..., Z9.
- *jjjj* is the first four characters of the job name. The product assigns the job name.
- *dd* is a set of two alphanumeric characters (AA - 99) that Tools Customizer assigns to identify a DB2 entry.
For example, the job shown as ssCF2Add in this topic might be generated as A4CF2AAA.

**Customization values for the Discover EXEC**

**Description**

Use the following worksheet to identify and record the customization values for the Tools Customizer Discover EXEC. The values in this worksheet are for extracting information from a product that has already been customized. During the customization process, you will enter these values on panel CCQPDSC.

**Note:** Complete this worksheet only if you are recustomizing a product that has previously been customized by using Tools Customizer.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Sample or default value</th>
<th>Your value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Discover EXEC for extracting information from an already customized product</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Discover EXEC library</td>
<td>The fully qualified data set name that contains the product Discover EXEC.</td>
<td>The metadata library that you specified on the Specify the Metadata Library panel (CCQPHLQ).</td>
</tr>
<tr>
<td>Discover EXEC name</td>
<td>The name of the Discover EXEC.</td>
<td>HAADISC</td>
</tr>
<tr>
<td>Discover output data set</td>
<td>The name of the data set for the output from the product Discover EXEC.</td>
<td>The name of the discover output library that you entered on the settings panel.</td>
</tr>
</tbody>
</table>

**Information for Discover EXEC section**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Sample or default value</th>
<th>Your value</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Automation Tool load library</td>
<td>This parameter specifies the new DB2 Automation Tool load library that was installed as part of the SMP/E process.</td>
<td>DB2TOOL.HAA420.SHAALOAD</td>
</tr>
<tr>
<td>New FEC load library</td>
<td>This parameter specifies the new FEC load library if FEC was not installed into the same libraries as DB2 Automation Tool.</td>
<td>DB2TOOL.FEC130.SFECLOAD</td>
</tr>
<tr>
<td>Previous control file</td>
<td>This parameter specifies the DB2 control file used with the previous version of DB2 Automation Tool.</td>
<td>HAA.DB2.CONTROL</td>
</tr>
<tr>
<td>Configuration ID</td>
<td>The DB2 Automation Tool three-character configuration name.</td>
<td>HAA</td>
</tr>
</tbody>
</table>
### Product to Customize section

**Description**

The parameters that are listed in the Product to Customize section are read-only. They contain information that was provided on other panels, by Tools Customizer, or by the DB2 Automation Tool metadata data set.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Sample or default value</th>
<th>Your value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Previous Startup CLIST data set</td>
<td>DB2TOOL.HAA410.SHAASAMP</td>
<td></td>
</tr>
<tr>
<td>Previous Startup CLIST 2</td>
<td>HAAV41C</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Discovered?</th>
<th>Source of this value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Product metadata library</td>
<td>No</td>
<td>This value is specified on the Specify the Product to Customize panel (CCQPHLQ).</td>
</tr>
<tr>
<td>LPAR</td>
<td>No</td>
<td>This value is supplied by Tools Customizer.</td>
</tr>
<tr>
<td>Product name</td>
<td>No</td>
<td>This value is provided by the product metadata file.</td>
</tr>
<tr>
<td>Version</td>
<td>No</td>
<td>This value is provided by the product metadata file.</td>
</tr>
<tr>
<td>Product customization library</td>
<td>No</td>
<td>This value is derived from the user-specified customization library qualifier on Tools Customizer Settings panel (CCQPSET)</td>
</tr>
</tbody>
</table>
## Required parameters section

### Description

The parameters in this section are used by multiple steps of the customization process; refer to the parameter descriptions for details. During the customization process, you will enter these values on panel CCQPPRD.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Discovered?</th>
<th>Default value</th>
<th>Your value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Startup CLIST library</strong></td>
<td>Yes</td>
<td>Yes</td>
<td>DB2TOOL.HAA420. CLIST</td>
<td></td>
</tr>
<tr>
<td>This parameter specifies the CLIST library in which to store the newly created DB2 Automation Tool CLISTS. These CLISTS are used to define the ISPF environment and to invoke the DB2 Automation Tool ISPF interface.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Automation Tool load library</strong></td>
<td>Yes</td>
<td>Yes</td>
<td>DB2TOOL.HAA420. SHAALOAD</td>
<td></td>

</tbody>
</table>

**Task: Configure the product CLISTS**

**Description**

This task builds the jobs to configure the startup CLISTS. During the customization process, you enter these values on panel CCQPRD.

This task is **required**.

**Jobs generated**

This task generates the following jobs based on the template that is listed:

<table>
<thead>
<tr>
<th>Job name</th>
<th>Template</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ssV42</td>
<td>HAAV42</td>
<td>Configures and adds startup CLIST 1 to CLIST library.</td>
</tr>
<tr>
<td>ssV42C</td>
<td>HAAV42C</td>
<td>Configures and adds startup CLIST 2 to CLIST library.</td>
</tr>
<tr>
<td>ssEXECs</td>
<td>HAAEXECs</td>
<td>Adds DB2 Automation Tool required EXECs to CLIST library.</td>
</tr>
</tbody>
</table>

**Required authority**

The user ID that configures or updates CLISTS must have write access to the startup CLIST library.

<table>
<thead>
<tr>
<th>Step or parameter</th>
<th>Required?</th>
<th>Discovered?</th>
<th>Default value</th>
<th>Your value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configure Startup CLISTS</td>
<td>Yes</td>
<td>–</td>
<td>Selected</td>
<td></td>
</tr>
<tr>
<td>Step to configure the CLISTS.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Startup CLIST 1</td>
<td>Yes</td>
<td>No</td>
<td>HAAV42</td>
<td></td>
</tr>
<tr>
<td>The name of the first startup CLIST.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Startup CLIST 2</td>
<td>Yes</td>
<td>No</td>
<td>HAAV42C</td>
<td></td>
</tr>
<tr>
<td>The name of the second startup CLIST.</td>
<td></td>
<td></td>
<td></td>
<td></td>

<td></td>
<td></td>
</tr>
<tr>
<td>FEC SAMPLIB</td>
<td>No</td>
<td>No</td>
<td>None</td>
<td></td>
</tr>
<tr>
<td>This parameter specifies the FEC sample library where the FECTSOC CLIST resides and is only required if FEC was not installed into the same libraries as DB2 Automation Tool</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Task: Create the control file**

**Description**

This task creates a new control file. The control file is a required VSAM KSDS used by DB2 Automation Tool to store certain product and DB2 related values. It is not necessary to create a new one if one exists. DB2 Automation Tool can share a control file with other DB2 Tools products that use the same type of control file. During the customization process, you enter these values on panel CCQPPRD.

This task is optional.

**Jobs generated**

This task generates the following jobs based on the template that is listed:

<table>
<thead>
<tr>
<th>Job name</th>
<th>Template</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ssCNTFL</td>
<td>HAACNTFL</td>
<td>Creates the control file.</td>
</tr>
</tbody>
</table>

**Required authority**

The user ID that runs the job to create the control file must have the authority to create the control file data set.
### Task: Update the control file

#### Description
This task updates the DB2 Automation Tool control file. During the customization process, you enter these values on panel CCQPPRD.

This task is required.

#### Jobs generated
This task generates the following jobs based on the template that is listed:

<table>
<thead>
<tr>
<th>Job name</th>
<th>Template</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ssCF2dd</td>
<td>HAACF2A</td>
<td>Updates the control file (SSID-specific parameters).</td>
</tr>
<tr>
<td>ssCF1A</td>
<td>HAACF1A</td>
<td>Updates the control file with parameters for DB2 Recovery Expert.</td>
</tr>
<tr>
<td>ssCF1B</td>
<td>HAACF1B</td>
<td>Updates the control file with parameters for DB2 High Performance Unload.</td>
</tr>
</tbody>
</table>

#### Required authority
The user ID that runs the jobs to update the control file must have write authority to the control file data set.

### Step or parameter

<table>

<td>No</td>
<td>Yes</td>
<td>420</td>
</tr>
</tbody>
</table>

### Task: DB2 Utilities Solution Pack Setup

**Description**

This task prepares DB2 Automation Tool to run in a DB2 Utilities Solution Pack environment. If you have not purchased DB2 Utilities Solution Pack, do not select this task. During the customization process, you select this task on panel CCQPPRD.

This task is *optional*.

**Jobs generated**

This task generates the following jobs based on the template that is listed:

<table>
<thead>
<tr>
<th>Job name</th>
<th>Template</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ssUSL.dd</td>
<td>HAAUSL</td>
<td>Sets up DB2 Automation Tool for use with DB2 Utilities Solution Pack.</td>
</tr>
</tbody>
</table>
**Required authority**

The user ID that runs this job must have SYSADM authority on the DB2 subsystems.

<table>
<thead>
<tr>
<th>Step or parameter</th>
<th>Required?</th>
<th>Discovered?</th>
<th>Default value</th>
<th>Your value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Register with Autonomics Director</td>
<td>No</td>
<td>--</td>
<td>Not selected</td>
<td></td>
</tr>
</tbody>
</table>

**Task: Create or update DB2 objects**

**Description**

This set of tasks creates the DB2 Automation Tool repository objects for your version of DB2. During the customization process, you enter these values on panel CCQPGRD.

The repository jobs determine whether repository objects need to be created or updated based on the version and release of DB2 Automation Tool, and the DB2 version on which DB2 Automation Tool is being installed. Ensure that the mode and levels are correct for each SSID. Run the generated job on the LPAR appropriate for the subsystem.

DDL changes to the DB2 Automation Tool repository are not common. However, missing columns or objects can result in unpredictable behavior if those items are required for functionality. If in doubt, submit the DDL and allow DB2 Automation Tool to update the repository.

This task is required.

**Jobs generated**

This task generates the following jobs based on the template that is listed:

<table>
<thead>
<tr>
<th>Job name</th>
<th>Template</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ssDELEdd</td>
<td>HAADELE</td>
<td>Drops the DB2 Automation Tool repository.</td>
</tr>
<tr>
<td>ssDDLYdd</td>
<td>HAADDLY</td>
<td>Creates and updates the DB2 Automation Tool repository in preview mode.</td>
</tr>
<tr>
<td>ssDDLXdd</td>
<td>HAADDLX</td>
<td>Creates and updates the DB2 Automation Tool repository in execute mode.</td>
</tr>
<tr>
<td>ss#IDCdd</td>
<td>HAA#IDC1</td>
<td>Creates user-managed index files on SYSIBM.SYSCOPY.</td>
</tr>
<tr>
<td>ssDDL2dd</td>
<td>HAADDL2</td>
<td>Create optional STOGROUP-defined indexes on SYSIBM.SYSTABLES, SYSIBM.SYSTABLESTATS, SYSIBM.SYSTABLES_HIST, and SYSIBM.SYSCOPY.</td>
</tr>
<tr>
<td>ss#DCPdd</td>
<td>HAA#DCPY</td>
<td>Copy the DB2 Automation Tool repository.</td>
</tr>
</tbody>
</table>

**Required authority**

The user ID that runs these jobs to create DB2 objects must have SYSADM authority on the DB2 subsystems.
<table>
<thead>
<tr>
<th>Step or parameter</th>
<th>Required?</th>

**Task: Automation Tool Plans and Packages**

**Description**

This task binds the plans and packages and required for using DB2 Automation Tool, optionally frees plans and packages before a rebind, and grants execute authority on the plans. During the customization process, you enter these values on panel CCQPPRD.

This task is **required**.

**Jobs generated**

This task generates the following jobs based on the template that is listed:
<table>
<thead>
<tr>
<th>Job name</th>
<th>Template</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ssFREEdd</td>
<td>HAAFREE</td>
<td>Frees the plans and packages.</td>
</tr>
<tr>
<td>ss#BNDdd</td>
<td>HAA#BND</td>
<td>Binds plans and packages.</td>
</tr>
<tr>
<td>ssGRANdd</td>
<td>HAAGRANT</td>
<td>Grants execute authority to use DB2 Automation Tool.</td>
</tr>
</tbody>
</table>

**Required authority**

The user ID that runs the ssFREEdd, ss#BNDdd and the ssGRANdd jobs must have SYSADM authority on the DB2 subsystems.

<table>
<thead>
<tr>
<th>Step or parameter</th>

</tr>
</tbody>
</table>

**Task: Management Console Stored Procedures**

**Description**

This task creates and configures the stored procedures required for the Management Console. During the customization process, you enter these values on panel CCQPPRD.

This task is optional.

**Jobs generated**

This task generates the following jobs based on the template that is listed:

<table>
<thead>
<tr>
<th>Job name</th>
<th>Template</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ssFRSPdd</td>
<td>HAAFRSP</td>

**Task: Job Tracking Started Task**

**Description**

DB2 Automation Tool uses a started task to track job execution results and to enable the restartability feature for DB2 Automation Tool-generated utility jobs. During the customization process, you enter these values on panel CCQPPRD.

This task is *optional*.

**Jobs generated**

This task generates the following jobs based on the template that is listed:

<table>
<thead>
<tr>
<th>Jobname</th>
<th>Template</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ssPROC</td>
<td>HAAPROC</td>
<td>Generates the job tracking started task procedure.</td>
</tr>
<tr>
<td>ssPARMS</td>
<td>HAAPARMS</td>
<td>Generates the job tracking started task parameter file.</td>
</tr>
</tbody>
</table>

**Required authority**

The user ID that runs the ssPROC and ssPARMS jobs to create the job tracking task procedure and parm file must have write access to the libraries where the started task and started task PARMLIB member will be written.
Task: Install the sample profiles

Description
This task installs sample profiles for use with DB2 Automation Tool. These profiles are profiles are optional, but can help you quickly set up job profiles to perform maintenance. During the customization process, you enter these values on panel CCQPPRD.

This task is optional.

Jobs generated
This task generates the following jobs based on the template that is listed:

<table>
<thead>
<tr>
<th>Jobname</th>
<th>Template</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ssLOADdd</td>
<td>HAALOADS</td>
<td>Installs the sample profiles.</td>
</tr>
</tbody>
</table>

Required authority
The user ID that runs the ssLOADdd job to install the sample profiles must have SYSADM authority on the DB2 subsystems and read access to the DB2 Automation Tool sample library (SHAASAMP).
Task: Add Automation Tool to the DB2 Admin Launchpad

Description
This task customizes the EXEC that, when executed, adds DB2 Automation Tool to the DB2 Administration Tool Launchpad. During the customization process, you enter these values on panel CCQPPRD.

This task is optional.

Jobs generated
This task generates the following jobs based on the template that is listed:

<table>
<thead>
<tr>
<th>Jobname</th>
<th>Template</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ssADBI</td>
<td>HAAAD8I</td>
<td>Creates the ssADBI EXEC that, when run, adds DB2 Automation Tool to the DB2 Administration Tool Launchpad.</td>
</tr>
</tbody>
</table>

Required authority
The user ID that runs ssADBI job must have write access to the DB2 Automation Tool CLIST library and must have the required authorities to modify the DB2 Administration Tool Launchpad.

<table>
<thead>
<tr>
<th>Step or parameter</th>
<th>Required?</th>
<th>Discovered?</th>

</tbody>
</table>

DB2 Parameters section

Description
This section contains DB2 parameters. During the customization process, you enter these values on panel CCQPPDB.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Discovered?</th>
<th>Default value</th>
<th>Your value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group attach name</td>
<td>No</td>
<td>No</td>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>
### General DB2 Information - common

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Discovered?</th>
<th>Default value</th>
<th>Your value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Mode</strong></td>
<td>Yes</td>
<td>No</td>
<td>NFM</td>
<td></td>
</tr>
<tr>
<td><strong>Level number</strong></td>
<td>Yes</td>
<td>No</td>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

#### Mode
This parameter indicates the mode in which the DB2 subsystem is running. The following values are valid:
- CM is compatibility mode on all listed DB2 versions except DB2 10.
- CM8 is conversion mode from DB2 V8 on DB2 10.
- CM9 is conversion mode from DB2 Version 9.1 on DB2 10.
- NFM is new-function mode on all listed DB2 versions.

#### Level number
This parameter indicates the version, release, and modification level of the DB2 subsystem. The following values are valid:
- 101 is valid only for modes CM8, CM9 or NFM.
- 111 is valid only for modes CM or NFM.

### DB2 Libraries - common

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Discovered?</th>
<th>Default value</th>
<th>Your value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Load library</strong></td>
<td>Yes</td>
<td>Yes</td>
<td>DSN.SDSNLOAD</td>
<td></td>
</tr>
<tr>
<td><strong>Run library</strong></td>
<td>Yes</td>
<td>No</td>
<td>DSN.RUNLIB.LOAD</td>
<td></td>
</tr>
<tr>
<td><strong>Exit library</strong></td>
<td>Yes</td>
<td>Yes</td>
<td>DSN.SDSNEXIT</td>
<td></td>
</tr>
<tr>
<td><strong>Bootstrap data set</strong></td>
<td>Yes</td>
<td>Yes</td>
<td>DSN.SDSNBSDS</td>
<td></td>
</tr>
</tbody>
</table>

#### Load library
The names of the data sets that make up the current load library concatenation for DB2. The load library usually consists of a subsystem-specific DSNEXIT library, the base DSNEXIT library for the current DB2 version, and the base DSNLOAD library for the current DB2 version.

#### Run library
This parameter indicates the data set name of the DB2 run library where DSN1TIAD is located.

#### Exit library
This parameter indicates the names of the data sets that make up the current DB2 exit library concatenation for DB2.

</tr>
</tbody>
</table>

**Worksheets: DB2 High Performance Unload**

Refer to the following information before you customize DB2 High Performance Unload.

**Discover process parameters**

The Discover process parameters on the Discover Customized Product Information panel (CCQPDCS) in Tools Customizer are required to run the Discover EXEC.

You can accept the default values for the Discover process parameters, or you can customize them based on your specific requirements. All Discover process parameters are required.

The following list describes the Discover process parameters.

**Name of the PARMLIB library of a previous version (4.2.0 and later)**

The name of PARMLIB library (INZPLIB/INFPPLIB) of a previous version. Use
this field when the previous installation was done through TCz (DB2 HPU
version 4.2.0 and later). Example: oldhlq.SINZAMP. There is no default value.

**Previous data set of variables to be retrieved (4.1.0 and earlier)**
The name of the data set that contains the variable to be discovered
(INZRSAVE or INZTVAR member). Use this field when the previous
installation was done without TCz (DB2 HPU version 4.1.0 and earlier).
Example: oldhlq.SINZRAV(INZRSAVE). There is no default value.

**Previous data set with customized file dsnames (4.1.0 and earlier)**
The name of the data set that contains customized files dsnames (INZTDSN,
member). Use this field when the previous installation was done without TCz
(DB2 HPU version 4.1.0 and earlier). Example: oldhlq.SINZAMP(INZTDSN).
There is no default value.

**Verbose mode for discover procedure........OFF (OFF,ON)**
Specify ON to enable display of the trace information issued by the discover
process. Otherwise, specify OFF.

**DB2 HPU library dsnames**
The DB2 HPU library dsnames section on the Product Parameters panel
(CCQPPRD) in Tools Customizer contains the dsnames of the DB2 HPU libraries.

The following list describes the dsnames:

**Load modules library (SINZLOAD)**
This parameter is required. It specifies the dsname of the load modules library
(SINZLOAD).
In previous releases of DB2 HPU, the name of this parameter was VIZ003.

**APF load modules library (SINZLINK)**
This parameter is required. It specifies the dsname of the APF load modules
library (SINZLINK).
In previous releases of DB2 HPU, the name of this parameter was VIZ004.

**Samples library (SINZSAMP)**
The dsname of the samples library (INZSAMP).

**PARMLIB library (INZPLIB/INFPLIB)**
This parameter is required. It specifies the dsname of the PARMLIB library
(INZPLIB). Do not use the SINZSAMP library. This library is handled by DB2
HPU under the INFPLIB ddname.

**Requirement:** This library must be the same as the one that is specified in the
INZTDSN member. If you do not use this library, DB2 HPU cannot read the
customization correctly.
In previous releases of DB2 HPU, the name of this parameter was VIZ007.

**Product's DBRM library (SINZDBRM)**
This parameter is required. It specifies the dsname of the DBRM library
(SINZDBRM).
In previous releases of DB2 HPU, the name of this parameter was VIZ012.

**REXX EXEC library (SINZCLST)**
This parameter is required. It specifies the dsname of the REXX EXEC library
(SINZCLST).
ISPF LOAD modules library (SINZLLIB)
This parameter is required to run the DB2 HPU interactive component. It specifies the dsname of the ISPF load module library (SINZLLIB) that contains the load modules.

In previous releases of DB2 HPU, the name of this parameter was VIZ013.

ISPF messages library (SINZMLIB)
This parameter is required to run the DB2 HPU interactive component. It specifies the dsname of the ISPF messages library (SINZMLIB) that contains the messages.

In previous releases of DB2 HPU, the name of this parameter was VIZ015.

ISPF panels library (SINZPLIB)
This parameter is required to run the DB2 HPU interactive component. It specifies the dsname of the ISPF panels library (SINZPLIB) that contains the ISPF panels.

In previous releases of DB2 HPU, the name of this parameter was VIZ016.

ISPF skeletons library (SINZSLIB)
This parameter is required to run the DB2 HPU interactive component. It specifies the dsname of the ISPF skeletons library (SINZSLIB) that contains the skeletons.

In previous releases of DB2 HPU, the name of this parameter was VIZ017.

ISPF tables library (SINZTLIB)
This parameter is required to run the DB2 HPU interactive component. It specifies the dsname of the ISPF tables library (SINZTLIB) that contains the tables.

In previous releases of DB2 HPU, the name of this parameter was VIZ018.

DB2 HPU DB2 parameters
The DB2 parameters section on the Product Parameters panel (CCQPPRD) in Tools Customizer contains the DB2 parameters that are used by DB2 HPU.

You can accept the default values for the DB2 parameters, or you can configure them based on your specific requirements. Some DB2 parameters are mandatory and must be configured.

The following list describes the common DB2 parameters. The parameters are listed in the following format:

description (Vxxnnnn/parameter-name)

Percentage of displaced pages in inline FIC (VUX023/PGDFIN)
This parameter is optional. It specifies the estimated value of the percentage of displaced pages in inline full-image copies (FIC).
Valid values are 0 - 100. The default value is 20.

The corresponding SYSIN keyword is PGDFIN in the Technical Parameters options block, which can be coded in the GLOBAL OPTIONS block.

In previous releases of DB2 HPU, the name of this parameter was VUX023/PGDFIN.

Use real-time statistics tables for size estimation (VUX036/RTSESTIM)
This parameter is optional. Specify YES to use the real-time statistics tables, when they are available, to estimate the number of rows of the table space to
be unloaded. Otherwise, specify NO. This estimate is used to allocate the output data set when a TEMPLATE is used, to set the sort program parameters when an ORDER BY clause is specified, or both.

In previous releases of DB2 HPU, the name of this parameter was VUX036/RTSESTIM.

The default value is NO.

**Maximum degree of parallelism for SELECT (VUX031/DB2PARAL)**

This parameter is optional. It specifies the parallelism degree for an UNLOAD command when several SELECT statements are processed by using DB2 access (using DB2 FORCE or DB2 YES with unsupported SELECT statements).

The value that you specify indicates the maximum number of SELECT statements that are processed in parallel. The value that you specify indicates the maximum number of SELECT statements that are processed in parallel.

In previous releases of DB2 HPU, the name of this parameter was VUX031/DB2PARAL.

Valid values are 1 - 65535. The default value is 5.

**Application plan for DB2 HPU (VUM011/PLANOBJT)**

This parameter is required. It specifies the plan name for the interactive application and the batch jobs.

Valid values are valid DB2 plan names.

In previous releases of DB2 HPU, the name of this parameter was VUM011/PLANOBJT.

**Package collection for DB2 HPU (VUM030/COLLOBJT)**

This parameter is required. It specifies the name of the collection that is used to bind the DB2 HPU packages.

In previous releases of DB2 HPU, the name of this parameter was VUM030/COLLOBJT.

**Owner of the plan created for DB2 HPU (VUM012/PLANOWN)**

This parameter is required. It specifies the name of the owner of the plan to be used to bind the DB2 HPU plan.

Specify one value for each DB2 subsystem that you defined.

In previous releases of DB2 HPU, the name of this parameter was VUM012/PLANOWN.

**Grant on the plan created for DB2 HPU (VUX011)**

This parameter is required. It specifies whether to use the GRANT TO PUBLIC or the GRANT TO USER statement to grant privileges to the plan that was created for DB2 HPU.

Specify one value for each DB2 subsystem that you defined with variable VZD001.

Valid values are PUBLIC and USER.

In previous releases of DB2 HPU, the name of this parameter was VUX011.

**Quiesce of SYSDBASE and DBD01 for the batch utilities (VUM014/QUIESCAT)**

This parameter is optional. It specifies whether a quiesce point is to be taken on the following table spaces before the job is run.

- DSNDB01.DBD01
- DSNDB06.SYSCOPY
Specify one of the following values:

**YES**
A quiesce point is taken at run time unless keyword QUIESCECAT NO was specified in the SYSIN of DB2 HPU.

**NO**
A quiesce point is not taken at run time unless keyword QUIESCECAT YES was specified in the SYSIN of DB2 HPU.

**OFF**
A quiesce point is never taken at run time, even if keyword QUIESCECAT YES was specified in the SYSIN of DB2 HPU.

**FORCE**
A quiesce point is always taken at run time, even if keyword QUIESCECAT NO was specified in the SYSIN of DB2 HPU.

QUIESCAT is forced to NO in DB2 10 for z/OS ENFM and later releases because DB2 HPU accesses the catalog in SQL only at that DB2 level.

The default value is YES.

In previous releases of DB2 HPU, the name of this parameter was VUM014/QUIESCAT.

**User who quiesces the catalog table spaces (VUM020/QUIESUSR)**
This parameter is optional. It specifies the user who will run the QUIESCE utility on the DB2 catalog table spaces. Specify one value for each DB2 subsystem that you defined with variable VZD001.

Specify one of the following values:

**CURRENT_USER**
The user who submits the job will be used to run the QUIESCE utility on the DB2 catalog table spaces.

**USER name**
A specific user name is used to the QUIESCE utility on the DB2 catalog table spaces. The name can be 1-7 characters.

The default value is CURRENT_USER.

In previous releases of DB2 HPU, the name of this parameter was VUM020/QUIESUSR.

**User who quiesces the table space to be unloaded (VUM031/QUITUSR)**
This parameter is optional. If a quiesce is requested, this parameter specifies the user who will run the QUIESCE utility on the table space to be unloaded. Specify one value for each DB2 subsystem that you defined with variable VZD001.

Specify one of the following values:
**CURRENT_USER**

The user who submits the job is used to run the QUIESCE utility on the table space to be unloaded.

**USER name**

A specific user name is used to run the QUIESCE utility on the table space to be unloaded. The name can be 1-7 characters.

In previous releases of DB2 HPU, the name of this parameter was VUM031/QUITSSUSR.

The default value is CURRENT_USER.

**SQL access for reading DB2 catalog (VUM027/SQLACCES)**

This parameter is optional. It specifies which of the following three methods is used to access the DB2 catalog:

**DIRECT**

Direct access on all catalog information

**SQL**

SQL access on all catalog information

**MIXED**

Direct access for all information except for the IPREFIX of the SYSINDEXPART and SYSTABLEPART tables (the I/J), which might change after an online reorganization

Specify one of the following values:

**MINIMAL**

The DB2 catalog is accessed by using DIRECT mode (DIRECT access maximum) and is completed by using the SQL mode (SQL access minimum).

**AUTO**

The DB2 catalog is accessed either in DIRECT mode or in SQL mode.

**YES**

The DB2 catalog is accessed only in SQL mode.

**NO**

The DB2 catalog is accessed only in DIRECT mode.

When SQL access is used to read the DB2 catalog, the user ID that is specified in PARMLIB variable VUM032/ACTLGUSR must have SELECT authority on the tables of the DB2 catalog that DB2 HPU accesses.

The access method that is used depends on the SQLACCESS setting and whether QUIESCECAT comes from the PARMLIB or from the SYSIN. The following table shows the access method that is used by DB2 HPU based on the SQLACCESS and QUIESCECAT settings.

<table>
<thead>
<tr>
<th>SQLACCESS value</th>
<th>QUIESCECAT value</th>
<th>Access method used</th>
</tr>
</thead>
<tbody>
<tr>
<td>YES</td>
<td>Any</td>
<td>SQL</td>
</tr>
<tr>
<td>NO</td>
<td>Any</td>
<td>DIRECT</td>
</tr>
<tr>
<td>AUTO</td>
<td>NO</td>
<td>SQL</td>
</tr>
<tr>
<td>AUTO</td>
<td>YES</td>
<td>DIRECT</td>
</tr>
<tr>
<td>MINIMAL</td>
<td>NO</td>
<td>MIXED</td>
</tr>
</tbody>
</table>
Table 2. DB2 catalog access dependencies (continued)

<table>
<thead>
<tr>
<th>SQLACCES value</th>
<th>QUIESCECAT value</th>
<th>Access method used</th>
</tr>
</thead>
<tbody>
<tr>
<td>MINIMAL</td>
<td>YES</td>
<td>DIRECT</td>
</tr>
</tbody>
</table>

For a table space that was not altered recently, using MIXED access with a QUIESCECAT setting of NO guarantees a consistent reading of information from the DB2 catalog, even if an online reorganization (other than an ALTER operation) was recently done. Using MINIMAL provides the best compromise between consistency and speed.

SQLACCES is forced to YES in DB2 10 for z/OS ENFM and later releases because DB2 HPU only accesses the catalog in SQL at that DB2 level.

The default value is MINIMAL.

The corresponding SYSIN keyword is SQLACCES in the Technical Parameters options block, which can be coded in the GLOBAL OPTIONS block.

In previous releases of DB2 HPU, the name of this parameter was VUM027/SQLACCES.

User who runs the DISPLAY command (VUM028/DISPLUSR)

This parameter is optional. It specifies the user who will run the DISPLAY command.

**CURRENT_USER**

The user who submitted the job is used to run the DISPLAY command. CURRENT_USER is the default value.

**USER** _name_

A specific user name is used to run the DISPLAY command. The name can be 1 - 7 characters.

Specify one value for each DB2 subsystem that you defined with variable VZD001.

The default value is CURRENT_USER.

In previous releases of DB2 HPU, the name of this parameter was VUM028/DISPLUSR.

Use DB2 to process unsupported SELECT statements (VUU011/ULSEDB2)

This parameter is optional. It specifies whether DB2 will process SELECT statements when the statements are not supported by DB2 HPU. This parameter is used only if the DB2 option is not specified in the SYSIN. When COPYDDN_STRCT(YES) is specified in the VUU030/ULOPTNS parameter, unloading data from the table by using DB2 instead of unloading data from the image copy is not allowed. Therefore, if you are unloading from an image copy and COPYDDN_STRCT(YES) is specified, the value of the VUU001 parameter is forced to NO.

Specify one of the following values:

**NO** SELECT statements that are not supported by DB2 HPU will not be processed by DB2.

**YES** SELECT statements that are not supported by DB2 HPU will be processed by DB2, unless DB2 NO was specified in the SYSIN of DB2 HPU.

The default value is YES.
In previous releases of DB2 HPU, the name of this parameter was VUU011/ULSEDDB2.

**Lock the tables in the table space (VUU012/ULLOCK)**

This parameter is optional. It specifies whether to lock the tables in the table space.

Specify one of the following values:

**NO** Tables in the table space are not to be locked unless YES was specified in the SYSIN of DB2 HPU.

**YES**

Tables in the table space are locked unless NO was specified in the SYSIN of DB2 HPU.

Specifying LOCK NO does not preclude DB2 from taking locks if SQL Access is used to access the data.

The default value is NO.

In previous releases of DB2 HPU, the name of this parameter was VUU012/ULLOCK.

**Quiesce the table space (VUU013/ULQSCE)**

This parameter is optional. It specifies whether to quiesce the table space.

Specify one of the following values:

**NO** The table space is not quiesced unless YES was specified in the SYSIN of DB2 HPU.

**YES**

The table space is quiesced unless NO was specified in the SYSIN of DB2 HPU.

The default value is NO.

Attention: DB2 HPU operates on the physical VSAM data set level that is outside of DB2. If you run DB2 HPU on a table in which a row was just inserted, the unloaded data might not contain the row that was inserted. The unloaded data does not show the row because DB2 might not have externalized the data to DASD yet. This situation can happen when you use DB2 HPU without issuing a QUIESCE (or STOP) on the object. Be careful when using QUIESCE NO.

In previous releases of DB2 HPU, the name of this parameter was VUU013/ULQSCE.

**Degree of parallel processing (VUU021/ULDEGREE)**

This parameter is applicable only when DB2 extracts data. It specifies the number of parallel tasks or I/O operations that DB2 can use to extract data from a partitioned table space.

Specify one of the following values:

1 Parallelism is not used.

**ANY**

DB2 HPU decides whether parallelism will be used.

**CURRENT_DEGREE**

DB2 HPU must keep the default value for the current degree that is set in the DB2 customization. If the PARMLIB variable is set to
CURRENT_DEGREE, DB2 HPU will not issue any SET CURRENT DEGREE statements before issuing the SELECT statement.

The default value is CURRENT_DEGREE.

The corresponding SYSIN parameter is ULDEGREE in the GLOBAL OPTIONS block.

In previous releases of DB2 HPU, the name of this parameter was VUU021/ULDEGREE.

**Default scheme for UNLOAD TABLESPACE (VUU023/UNLSCHM)**

This parameter is optional. It specifies the unload format for the data.

Specify one of the following values:

**ASCII**

Specifies that the unloaded data must be in ASCII format. DB2 HPU uses the ASCII CCSID of the subsystem, unless you override it by specifying the CCSID option in the SYSIN of DB2 HPU.

**ASIS**

Specifies that the data is unloaded in its original format. If the specification for the underlying table space cannot be determined (for example, if the data is processed by DB2), the CCSID that is returned by a standard prepare statement in SQLDA is used. You can also override ASIS by specifying the CCSID keyword.

Specifying ASIS does not mean that a conversion is not required. Conversion might still be required when columns that are not CHAR, VARCHAR, GRAPHIC, and VARGRA types are unloaded in an external format and when the schema of the unloaded table space is not system-EBCDIC.

DB2 HPU first converts the value to the external format (in system-EBCDIC), and the result is converted to the table space schema.

Similarly, the padding characters or field separators (FORMAT DELIMITED) are in system-EBCDIC by default. They are also converted to the table space schema if the table space schema is not EBCDIC.

Conversion is also required when the table space CCSID is not the same as the SYSIN CCSID and when the SELECT statement causes C'constants'.

**EBCDIC**

Indicates that the data is unloaded in EBCDIC format. DB2 HPU uses the EBCDIC CCSID of the subsystem unless you override it by specifying the CCSID keyword.

**UNICODE**

Indicates that the data is unloaded in UNICODE format. DB2 HPU uses the UNICODE CCSID of the subsystem unless you override it by specifying the CCSID option.

The default value is EBCDIC.

In previous releases of DB2 HPU, the name of this parameter was VUU023/UNLSCHM.

**Quiesce process (VUU028/ULQSCEBH)**

This parameter is optional. It specifies whether the process of updating physical objects in linear data sets (LDS) must be forced or only attempted.
Specify one of the following values:

**FORCE**
The process of updating physical objects in LDSs is forced, which means that the object is quiesced if possible; otherwise, a STOP/START is forced. The default value is FORCE.

**TRY**
The process of updating physical objects in LDSs is attempted, which means that the object is quiesced if possible; otherwise, the processing terminated in error.

The default value is FORCE.

In previous releases of DB2 HPU, the name of this parameter was VUU028/ULQSCEBH.

**DB2 HPU additional features (VUU030/ULOPTNS)**
This parameter is optional. Use this parameter to activate functions for DB2 HPU syntax. This parameter can receive a list of optional parameters, separated by commas, that modify DB2 HPU behavior. Use a continuation comma at the end of each line or fill in the line up to the end.

**LOADINDDN(YES)**
The INDDN ddname card is generated into the LOAD command. The variable ddname points to the data set that contains the unloaded data.

When a TEMPLATE is used to allocate the output file, DB2 HPU also generates a TEMPLATE in the LOADDDN file to allocate the input file for the LOAD.

**LOADINDDN(NO)**
The INDDN card is not generated into the LOAD command. The ddname points to the data set that contains the unloaded data.

When a TEMPLATE is used to allocate the output file, DB2 HPU does not generate a TEMPLATE in the LOADDDN file.

**DSNTIAULSTRICT(YES)**
The SELECT statements that are coded with FORMAT DSNTIAUL will function as if they are coded as FORMAT DSNTIAUL STRICT.

**DSNTIAULSTRICT(NO)**
The SELECT statements that are coded with FORMAT DSNTIAUL are not changed into FORMAT DSNTIAUL STRICT.

**Attention:** Changing the behavior of the DSNTIAUL format might affect the content of the unloaded data. Use the DSNTIAUL(YES) parameter and DSNTIAUL(NO) parameter with caution. See the *IBM DB2 High Performance Unload for z/OS V4.2 User’s Guide* for a description of the difference between specifying FORMAT DSNTIAUL and specifying FORMAT DSNTIAUL STRICT.

**DELIMITEDGRAPHEXT(YES)**
In the DELIMITED format, GRAPHIC and VARGRAPHIC columns are unloaded in ASCII or in EBCDIC as GRAPHIC EXTERNAL data, including the SO/SI characters.

**DELIMITEDGRAPHEXT(NO)**
In the DELIMITED format, GRAPHIC and VARGRAPHIC columns are unloaded in ASCII or in EBCDIC as GRAPHIC data, without the SO/SI characters.
The DELIMITEDGRAPHEXT parameter is used only for DB2 HPU syntax. It has no impact on Fast Unload or Unload Plus syntax and has no impact when GRAPHIC data is unloaded in UNICODE.

**ONDEMAND_RESOURCE_ALLOCATION(YES)**
When DB2 HPU processes a list of table spaces by using a LISTDEF and TEMPLATE in a single DB2 HPU step, TEMPLATE files and control blocks are allocated when the table space is processed and are freed afterwards. If you use LISTDEF, you can run DB2 HPU jobs with more table spaces that can be processed in a single DB2 HPU invocation. Specifying YES reduces the memory resources that DB2 HPU uses. If any part of the unload process fails, processing continues with other unload tasks, and the process that failed will be displayed in the list of failed processes that is indicated after message INZU361I.

**ONDEMAND_RESOURCE_ALLOCATION(NO)**
When DB2 HPU processes a list of table spaces by using a LISTDEF and TEMPLATE in a single DB2 HPU step, all resources are allocated at the beginning of the step. If any part of the unload process fails, processing stops, and DB2 HPU terminates immediately after the error.

**PADDING_STRICT(YES)**
The previous syntax for the PADDING option that allowed you to code a two-byte hexadecimal constant, such as PADDING x'hhhh', is not accepted. The default value for the DBCS padding character is always the DBCS space that was converted in the output CCSID.

**COPYDDN_STRICT(YES) or COPYDDN_STRICT(NO)**
In previous releases, when both COPYDDN and DB2 FORCE were used, COPYDDN was ignored, and the data was unloaded from the table. When COPYDDN and DB2 YES were used, results could change along with DB2 HPU maintenance. When an unsupported SELECT statement became supported because maintenance was applied, DB2 HPU unloaded the data from the image copy instead of from the table.

In both cases, the data source that was selected by DB2 HPU might not be the expected one. In later releases, COPYDDN and DB2 YES or DB2 FORCE will be made incompatible to avoid this ambiguous behavior.

You can enable the behavior of DB2 HPU V4.1 and later releases by specifying COPYDDN_STRICT(YES). Otherwise, specify COPYDDN_STRICT(NO), which is the default value.

In later releases, COPYDDN_STRICT(YES) or COPYDDN_STRICT(NO) will be ignored, and only the enhanced behavior, corresponding to the behavior when COPYDDN_STRICT(YES) is specified, will be available.

**BY_SQL_ONLY(WITH_UR)**
SELECT statements with the WITH_UR clause are always processed in SQL mode. SELECT statements without the WITH_UR clause are always processed in native mode.

**GBLPARAL_MAXPART_SET_NULL(YES) or GBLPARAL_MAXPART_SET_NULL(NO)**
Processing subsets of partitions (when you use MAXPART or ULMAXPAR when the specified value is less than the number of partitioned to be unloaded) and unloading without parallelism because GBLPARAL (NO) is specified are incompatible.

When VUU060/ULMAXPAR n and VUU036/GBLPARAL NO are specified together and are applicable to the unload in progress, GBLPARAL NO is
ignored, and the data is unloaded without parallelism at the partition level
unless GBLPARAL_MAXPART_SET_NULL(YES) is specified.

Specify GBLPARAL_MAXPART_SET_NULL(YES) to disable the processing
of the subset of partitions and unload the data without partition
parallelism instead. If you specify either the PARALLELISM or the
MAXPART keyword in the UNLOAD statement, specifying
GBLPARAL_MAXPART_SET_NULL(YES) does not affect parallelism.

**AUTO_UNCNT_MAX(unit_count_value)**
Sets the maximum value to be used as the unit count when the unit count
is dynamically determined by DB2 HPU. The value is determined by DB2
HPU when the value is not specified for the UNCNT option in the
TEMPLATE statement.

Valid values are 0 - 59.

**CHECK_CCSID_STRICT(YES|NO)**
Specifies with CCSID classes, such as SBCS or MIXED or DBCS, are
allowed.

**YES** Using an irrelevant CCSID class, such as SBCS or MIXED or DBCS,
in the CCSID(ccsid_spcs, ccsid_mixed, ccsid_dpcs) option is not
allowed.

**NO** Using an irrelevant CCSID class, such as SBCS or MIXED or DBCS,
in the CCSID(ccsid_spcs, ccsid_mixed, ccsid_dpcs) option is
allowed.

The default value is YES.

The default values are LOADINDDN(NO), DSNTIAULSTRICT(NO),
DELIMITEDGRAPHEXT(NO), ONDEMAND_RESOURCE_ALLOCATION(NO),
COPYDDN_STRICT(NO), and BY_SQL_ONLY().

**INSTREAM_XML_AS_CLOB(YES|NO)**
Specifies with CCSID classes, such as SBCS or MIXED or DBCS, are
allowed.

**INSTREAM_XML_AS_CLOB(YES)**
XML data unloaded in-stream are unloaded as CLOB data.

**INSTREAM_XML_AS_CLOB(NO)**
XML data unloaded in-stream are unloaded as XML unless
FORMAT DSNTIAUL STRICT is requested in which case the XML
data is unloaded as CLOB.

The default value is YES.

**INSTREAM_XML_AS_CLOB(YES|NO)**
Specifies with CCSID classes, such as SBCS or MIXED or DBCS, are
allowed.

**INSTREAM_XML_AS_CLOB(YES)**
XML data unloaded in-stream are unloaded as CLOB data.

**INSTREAM_XML_AS_CLOB(NO)**
XML data unloaded in-stream are unloaded as XML unless
FORMAT DSNTIAUL STRICT is requested in which case the XML
data is unloaded as CLOB.

The default value is YES.

**TRUE_UNICODE(YES|NO)**
**TRUE_UNICODE(YES)**
When conversion into unicode is requested with no target CCSID specification, the CSSID UTF8 is used as a target CCSID.

**TRUE_UNICODE(NO)**
When conversion into unicode is requested with no target CCSID specification, the default SBCS CSSID of the subsystem is used as a target CCSID.

The default value is NO.

**CHECK_CCSID_STRICT(YES|NO)**

**CHECK_CCSID_STRICT(YES)**
The use of irrelevant CCSID class (i.e. SBCS or MIXED or DBCS) in the CCSID (ccsid_sbc, ccsid_mixed, ccsid_dbsc) option is prohibited.

**CHECK_CCSID_STRICT(NO)**
The use of irrelevant CCSID class (i.e. SBCS or MIXED or DBCS) in the CCSID (ccsid_sbc, ccsid_mixed, ccsid_dbsc) option is allowed.

The default behavior of DB2 HPU is CHECK_CCSID_STRICT (YES).

In previous releases of DB2 HPU, the name of this parameter was VUU030/ULOPTNS.

**U_NULLCHAR**
UNLOAD PLUS NULLCHAR parameter default. This parameter is used for UNLOAD PLUS syntax and allows you to change the null indicator character in the output record.

Allowed values: xx where xx is any valid hexadecimal constant, except X'00'.

The default value is 6F.

**U_NULLTYPE**
UNLOAD PLUS NULLCHAR parameter default. This parameter is used for UNLOAD PLUS syntax and allows you to specify the location and length of the null indicator field in the output record.

Allowed values: T1/L1/T2/L2

The default value is T1.

**DB2 SETTINGS_SOURCE (AUTO|DSNHDEC)**

**AUTO**
The way DB2 HPU determines the DB2 settings depends on the DB2 version. Prior to DB2 V9, the DSNHDEC member from the DSNEXIT library is loaded; in DB2 V9 and later versions, the GETVARIABLE SQL function is used

**DSNHDEC**
the DSNHDEC member from the DSNEXIT library is used regardless of the DB2 release.

The default value is DB2_SETTINGS_SOURCE (AUTO).

**TEMPLATE_SSID_SUBSTITUTION (MEMBER_NAME)**
The SSID template variable is substituted with the current DB2 member name to which DB2 HPU has connected.
**TEMPLATE_SSID_SUBSTITUTION (GROUP_NAME)**

The SSID template variable is substituted with the DB2 member name in a non datasharing environment and with the group attachment name for datasharing environment.

Here is an example that shows how to specify a very long value for ULOPTNS:

```
TCUSTMZR Multiple Value Parameter Row 1 to 4 of 4

To add another value, issue the ADD command, and specify another value
for the parameter in the blank field in the Value column. Press enter to
save your values, or press End do save and exit.

Commands: ADD

Parameter description:
DB2 HPU additional features (VUU030/UNLOPTNS)

Line commands: D - Delete

Cmd Value:

(LOADINDDN (YES),DSNTIAULSTRING(YES),DELIMITEDGRAPHEXT(YES),
ONDHELDE_REQUIREMENT(YES),ONDEMAND_RESOURCE_ALLOCATION(YES),
PADDING_STRING(T(YES),COPYDDN_STRING(YES),BY_SQL_ONLY(WITH_UR),
GBLPAR
RAL_MAXPART_SET_NULL(YES))

---------------------------------End of values---------------------------

Command ===> Scroll ===>PAGE
```

**Check image copy before unloading (VUU033/ULCHKCPY)**

This parameter is optional. It specifies whether the dsname that was specified
by the COPYDDN parameter in the SYSIN should be checked.

Specify one of the following values:

**YES**

The dsname that was provided by the COPYDDN parameter in the SYSIN
is checked. This PARMLIB parameter is considered if CHECK or INLINE is
not specified in the SYSIN. The return code is 4, with a warning message
in the SYSGUT if the check against the SYSIBM.SYSCOPY failed, and the
FIC corresponding to the dsname is considered as a non-inline FIC.

**NO** The dsname is not checked.

The default value is NO.

In previous releases of DB2 HPU, the name of this parameter was
VUU033/ULCHKCPY.

**Option to modify the like behavior in SQL statement (VUU034/ULLIKE)**

This parameter is optional. It specifies how DB2 HPU handles UNICODE
MIXED strings in a LIKE predicate.

Specify one of the following values:

**STRICT**

Indicates that SQL rules are used to handle UNICODE mixed strings. To
handle UNICODE mixed strings by using SQL rules, DB2 HPU must
convert all operands (columns and masks of the LIKE predicate) in
UNICODE DBCS, which increases CPU consumption due to conversions
for each unloaded row.
FAST
Indicates that UNICODE mixed strings are considered as SBCS strings in LIKE predicates. The FAST option avoids MIXED to DBCS conversions and improves UNLOAD performances.

The default value is FAST.

In previous releases of DB2 HPU, the name of this parameter was VUU034/ULLIKE.

DB2 HPU response when a LOADDON cannot be generated (VUU038/UNLLDER)
This parameter is optional. It specifies whether DB2 HPU will stop when it is unable to generate a requested LOADDON. This situation can occur when the output format that was specified for DATE, TIME, or TIMESTAMP is not supported by the DB2 LOAD utility.

Specify one of the following values:

STOP
DB2 HPU stops with return code 8.

IGNORE
DB2 HPU issues a warning message and continues processing.

The default value is STOP.

In previous releases of DB2 HPU, the name of this parameter was VUU039/UNLLDER.

Unload HIDDEN Column by select * (VUU042/ULHIDDEN)
This parameter is optional. It specifies whether hidden columns will be selected when a SELECT * statement from a table name or from a LISTDEF is used. This parameter applies only to SELECT statements that are processed natively. Use the HIDDEN parameter of the EXEC card or the HIDDEN option of the OPTIONS block to override this parameter.

Specify one of the following values:

NO Specifies that hidden columns will not be unloaded when a SELECT * statement is used.

YES Specifies that hidden columns will be unloaded when a SELECT * statement is used. For SELECT statements that are processed by DB2, the HIDDEN option is ignored.

The default value is NO.

In previous releases of DB2 HPU, the name of this parameter was VUU042/ULHIDDEN.

Unload controlled access table in native mode (VUU062/ULACCTRL)
This parameter is optional. Use it to unload data from tables whose access is controlled at the row level or the column level. This parameter applies only when the data of the table is accessed in native mode, which means a physical unload or a logical unload with DB2 NO specified and a supported SQL statement. To unload a row-controlled table, specify DB2 FORCE or specify DB2 NO, and set the VUU062 parameter to YES.

YES Tables that are controlled at the row or column level can be unloaded in native mode.
Tables that are controlled at the row or column level cannot be unloaded.

The default value is NO.

In previous releases of DB2 HPU, the name of this parameter was VUU062/ULACCTRL.

**Technical parameter to unload XML columns (VUU063/ULOPLTX)**

This parameter is optional. Use this parameter to tune the low-level technical algorithm that DB2 HPU uses to unload XML data. If the default optimized values do not apply to your specific case, you can use the VUU063 parameter to enhance performance.

**Important:** Do not specify a value for this parameter unless IBM Software Support recommends a specific value.

This parameter does not have a default value.

An equivalent SYSIN keyword for this parameter does not exist.

In previous releases of DB2 HPU, the name of this parameter was VUU063/ULOPLTX.

**Parameter to identify ROW-TRANSACTION-TIMESTAMP (VUU065/ULRTTST)**

This parameter is optional. It specifies the technique to be used when generating the load SYSIN to identify the columns that are defined as ROW-TRANSACTION-TIMESTAMP.

This parameter applies only to natively processed SELECT statements.

Unsupported SELECT statements and SELECT statements that are processed with the DB2 FORCE option are ignored. In this case, the INGOREFIELDS and PERIODOVERRIDE keywords are not generated.

**IGNORE**

The load generates the column data. The generated load control statement contains the combination of INGOREFIELDS keyword and a dummy field name for the identify column.

**IGNOREOVERRIDE**

The unloaded data is loaded into the identify column. The PERIODOVERRIDE keyword is added to the load control statement, and the exact name of the identify column is kept. This option is available for DB2 Version 9 and later releases. For earlier version of DB2, the ignore version is used.

**IGNORE** the default value.

**Parameter to identify ROW-TRANSACTION-START-ID (VUU066/ULRTSID)**

This parameter is optional. It specifies the technique to be used when generating the load SYSIN to identify the columns that are defined as ROW-TRANSACTION-START-ID.

This parameter applies only to natively processed SELECT statements.

Unsupported SELECT statements and SELECT statements that are processed with the DB2 FORCE option are ignored. In this case, the INGOREFIELDS and PERIODOVERRIDE keywords are not generated.

**IGNORE**
The load generates the column data. The generated load control statement contains the combination of IGNOREFIELDS keyword and a dummy field name for the identify column.

TRANSIDOVERRIDE
The unloaded data is loaded into the identify column. The TRANSIDOVERRIDE keyword is added to the load control statement, and the exact name of the identify column is kept. This option is available for DB2 Version 9 and later releases. For earlier version of DB2, the ignore version is used.

IGNORE the default value.

**Option to specify conversion truncation policy (VUU067-/ULCNVTTRC)**
This parameter is optional. It allows you to specify what policy to apply when data truncation is needed because of a CCSID conversion. The value of ULCNVTTRC is overriden by the CONVERSION_TRUNCATION_ALLOWED syin option (see Technical Parameters option block). Allowed values: YES/NO

- **YES** Truncation of the output field after a CCSID conversion is allowed.
- **NO** Truncation of the output field after a CCSID conversion is forbidden. Records requesting truncation are discarded and the return code is set to 4.

The default value is YES.

**DB2 HPU output data parameters**
The DB2 HPU output data parameters section on the Product Parameters panel (CCQPPRD) in Tools Customizer contains the parameters for configuring output data.

You can accept the default values for the DB2 HPU output data parameters, or you can configure them based on your specific requirements.

The following list describes the DB2 HPU parameters. The parameters are listed in the following format:

*description* (Vxxnnnn/parameter-name)

**Override DCB DB2 HPU parameters (VUM029/DFSIGDCB)**
This parameter is optional. It specifies whether the DCB JCL parameter can be overridden in DB2 HPU syntax.

Specify one of the following values:

- **YES** For jobs that use DB2 HPU syntax, DB2 HPU ignores the DCB parameter in the JCL and sets the DCB attributes to the appropriate values.
- **NO** For jobs that use DB2 HPU syntax, DB2 HPU uses the DCB parameter in the JCL.

The default value is NO.

The corresponding SYSIN keyword is DFSIGDCB in the Technical Parameters options block, which can be coded in the GLOBAL OPTIONS block.

In previous releases of DB2 HPU, the name of this parameter was VUM029/DFSIGDCB.
Override DCB UNLOAD PLUS syntax (VUM029/DFSIGDCB)

This parameter is optional. It specifies whether the DCB JCL parameter can be overridden in UNLOAD PLUS syntax.

Specify one of the following values:

YES  For jobs that use UNLOAD PLUS syntax, DB2 HPU ignores the DCB parameter in the JCL and sets the DCB attributes to the appropriate values.

NO   For jobs that use UNLOAD PLUS syntax, DB2 HPU uses the DCB parameter in the JCL.

The default value is NO.

The corresponding SYSIN keyword is DFSIGDCB in the Technical Parameters options block, which can be coded in the GLOBAL OPTIONS block.

In previous releases of DB2 HPU, the name of this parameter was VUM029/DFSIGDCB.

Override DCB FAST UNLOAD syntax (VUM029/DFSIGDCB)

This parameter is optional. It specifies whether the DCB JCL parameter can be overridden in Fast Unload syntax.

Specify one of the following values:

YES  For jobs that use Fast Unload syntax, DB2 HPU ignores the DCB parameter in the JCL and sets the DCB attributes to the appropriate values.

NO   For jobs that use Fast Unload syntax, DB2 HPU uses the DCB parameter in the JCL.

The default value is NO.

The corresponding SYSIN keyword is DFSIGDCB in the Technical Parameters options block, which can be coded in the GLOBAL OPTIONS block.

In previous releases of DB2 HPU, the name of this parameter was VUM029/DFSIGDCB.

NULL indicator, format USER (VUU014/ULNULL)

This parameter is optional. Use this parameter to modify the null or not-null indicator.

OFF  The null indicator is not present in the output data set.

hhhh  The first two digits (one hexadecimal character) represent the null indicator for a null column. The last two digits (one hexadecimal character) represent the null indicator for a not-null column.

The default value is FF00.

The corresponding SYSIN parameter is OPTIONS NULL.

In previous releases of DB2 HPU, the name of this parameter was VUU014/ULNULL.

NULL indicator, format DSNTIAUL (VUU014/ULNULL)

This parameter is optional. Use this parameter to modify the null or not-null indicator.
**OFF**

The null indicator is not present in the output data set.

**hhhh**

The first two digits (one hexadecimal character) represent the null indicator for a null column. The last two digits (one hexadecimal character) represent the null indicator for a not-null column.

The default value is FF00.

The corresponding SYSIN parameter is OPTIONS NULL.

In previous releases of DB2 HPU, the name of this parameter was VUU014/ULNULL.

**NULL indicator, format VARIABLE (VUU014/ULNULL)**

This parameter is optional. Use this parameter to modify the null or not-null indicator.

**OFF**

The null indicator is not present in the output data set.

**hhhh**

The first two digits (one hexadecimal character) represent the null indicator for a null column. The last two digits (one hexadecimal character) represent the null indicator for a not-null column.

The default value is FF00.

The corresponding SYSIN parameter is OPTIONS NULL.

In previous releases of DB2 HPU, the name of this parameter was VUU014/ULNULL.

**NULL indicator, format EXTERNAL (VUU014/ULNULL)**

This parameter is optional. Use this parameter to modify the null or not-null indicator.

**OFF**

The null indicator is not present in the output data set.

**hhhh**

The first two digits (one hexadecimal character) represent the null indicator for a null column. The last two digits (one hexadecimal character) represent the null indicator for a not-null column.

The default value is FF00.

The corresponding SYSIN parameter is OPTIONS NULL.

In previous releases of DB2 HPU, the name of this parameter was VUU014/ULNULL.

**DATE, format USER (VUU015/ULDATEx)**

This parameter is optional. It specifies the default conversion type for a date column.

The default value is DATE_C.

The corresponding SYSIN parameter is OPTIONS DATE.

In previous releases of DB2 HPU, the name of this parameter was VUU015/ULDATEx.
DATE, format DSNTIAUL (VUU015/ULDATE)
This parameter is optional. It specifies the default conversion type for a date column.
The default value is DATE_DB2.
The corresponding SYSIN parameter is OPTIONS DATE.
In previous releases of DB2 HPU, the name of this parameter was VUU015/ULDATE.

DATE, format DELIMITED (VUU015/ULDATE)
This parameter is optional. It specifies the default conversion type for a date column.
The default value is DATE_C.
The corresponding SYSIN parameter is OPTIONS DATE.
In previous releases of DB2 HPU, the name of this parameter was VUU015/ULDATE.

DATE, format VARIABLE (VUU015/ULDATE)
This parameter is optional. It specifies the default conversion type for a date column.
The default value is DATE_C.
The corresponding SYSIN parameter is OPTIONS DATE.
In previous releases of DB2 HPU, the name of this parameter was VUU015/ULDATE.

DATE, format EXTERNAL (VUU015/ULDATE)
This parameter is optional. It specifies the default conversion type for a date column.
The default value is DATE_DB2.
The corresponding SYSIN parameter is OPTIONS DATE.
In previous releases of DB2 HPU, the name of this parameter was VUU015/ULDATE.

TIME, format USER (VUU016/ULTIME)
This parameter is optional. It specifies the default conversion type for a time column.
The default value is TIME_A.
The corresponding SYSIN parameter is OPTIONS TIME.
In previous releases of DB2 HPU, the name of this parameter was VUU016/ULTIME.

TIME, format DSNTIAUL (VUU016/ULTIME)
This parameter is optional. It specifies the default conversion type for a time column.
The default value is TIME_DB2.
The corresponding SYSIN parameter is OPTIONS TIME.
In previous releases of DB2 HPU, the name of this parameter was VUU016/ULTIME.
TIME, format DELIMITED (VUU016/ULTIME)

This parameter is optional. It specifies the default conversion type for a time column.

The default value is TIME_A.
The corresponding SYSIN parameter is OPTIONS TIME.
In previous releases of DB2 HPU, the name of this parameter was VUU016/ULTIME.

TIME, format VARIABLE (VUU016/ULTIME)

This parameter is optional. It specifies the default conversion type for a time column.

The default value is TIME_A.
The corresponding SYSIN parameter is OPTIONS TIME.
In previous releases of DB2 HPU, the name of this parameter was VUU016/ULTIME.

TIME, format EXTERNAL (VUU016/ULTIME)

This parameter is optional. It specifies the default conversion type for a time column.

The default value is TIME_DB2.
The corresponding SYSIN parameter is OPTIONS TIME.
In previous releases of DB2 HPU, the name of this parameter was VUU016/ULTIME.

TIMESTAMP, format USER (VUU017/ULTMSTP)

This parameter is optional. It specifies the default conversion type for a timestamp column.

The default value is TMSTP_B.
The corresponding SYSIN parameter is OPTIONS TIMESTAMP.
In previous releases of DB2 HPU, the name of this parameter was VUU017/ULTMSTP.

TIMESTAMP, format DSNTIAUL (VUU017/ULTMSTP)

This parameter is optional. It specifies the default conversion type for a timestamp column.

The default value is TMSTP_B.
The corresponding SYSIN parameter is OPTIONS TIMESTAMP.
In previous releases of DB2 HPU, the name of this parameter was VUU017/ULTMSTP.

TIMESTAMP, format DELIMITED (VUU017/ULTMSTP)

This parameter is optional. It specifies the default conversion type for a timestamp column.

The default value is TMSTP_B.
The corresponding SYSIN parameter is OPTIONS TIMESTAMP.
In previous releases of DB2 HPU, the name of this parameter was VUU017/ULTMSTP.
**TIMESTAMP, format VARIABLE (VUU017/ULTMSTP)**

This parameter is optional. It specifies the default conversion type for a timestamp column.

The default value is TMSTP_B

The corresponding SYSIN parameter is OPTIONS TIMESTAMP.

In previous releases of DB2 HPU, the name of this parameter was VUU017/ULTMSTP.

**TIMESTAMP, format EXTERNAL (VUU017/ULTMSTP)**

This parameter is optional. It specifies the default conversion type for a timestamp column.

The default value is TMSTP_B

The corresponding SYSIN parameter is OPTIONS TIMESTAMP.

In previous releases of DB2 HPU, the name of this parameter was VUU017/ULTMSTP.

**Decimal picture, format USER (VUU018/ULPIC)**

This parameter is optional. It specifies the numeric data display format.

Specify a value in the following format: `signpositionseparator`.

- **sign**
  - Specify one of the following values to print the sign:
    - `+`: The plus sign (+) is used for positive values.
    - `-`: The minus sign (-) is used for negative values.
    - `P`: The padding character is used for positive values, and the minus sign (-) is used for negative values.
  
  The default value for specifying the rules for printing is the minus sign.

- **position**
  - Specify one of the following values to position the sign:
    - **LEAD**
      - The sign is placed in front of the numeric value. The LEAD value is ignored for floating point numbers.
    - **TRAIL**
      - The sign is placed after the numeric value. The TRAIL value is ignored for floating point numbers.

  The default value for where to position the sign is LEAD.

- **separator**
  - Specify one of the following values for the decimal separator:
    - `.`: Use a period (.) as the decimal separator.
    - `,`: Use a comma (,) as the decimal separator.

  The default value -LEAD., which means that the sign is printed before the numeric value, the sign is shown only for negative values, and the period is used as the decimal separator.

  The corresponding SYSIN parameter is OPTIONS PIC.
In previous releases of DB2 HPU, the name of this parameter was VUU018/ULPIC.

**Decimal picture, format DSNTIAUL (VUU018/ULPIC)**

This parameter is optional. It specifies the numeric data display format.

Specify a value in the following format: `signpositionseparator`.

- **sign**
  - Specify one of the following values to print the sign:
    - `+` The plus sign (+) is used for positive values.
    - `-` The minus sign (-) is used for negative values.
    - `P` The padding character is used for positive values, and the minus sign (-) is used for negative values.

  The default value for specifying the rules for printing is the minus sign.

- **position**
  - Specify one of the following values to position the sign:
    - **LEAD**
      - The sign is placed in front of the numeric value. The LEAD value is ignored for floating point numbers.
    - **TRAIL**
      - The sign is placed after the numeric value. The TRAIL value is ignored for floating point numbers.

  The default value for where to position the sign is LEAD.

- **separator**
  - Specify one of the following values for the decimal separator:
    - `.` Use a period (.) as the decimal separator.
    - `,` Use a comma (,) as the decimal separator.

  The default value -LEAD., which means that the sign is printed before the numeric value, the sign is shown only for negative values, and the period is used as the decimal separator.

  The corresponding SYSIN parameter is OPTIONS PIC.

In previous releases of DB2 HPU, the name of this parameter was VUU018/ULPIC.

**Decimal picture, format DELIMITED (VUU018/ULPIC)**

This parameter is optional. It specifies the numeric data display format.

Specify a value in the following format: `signpositionseparator`.

- **sign**
  - Specify one of the following values to print the sign:
    - `+` The plus sign (+) is used for positive values.
    - `-` The minus sign (-) is used for negative values.
    - `P` The padding character is used for positive values, and the minus sign (-) is used for negative values.

  The default value for specifying the rules for printing is the minus sign.
position
Specify one of the following values to position the sign:

**LEAD**
The sign is placed in front of the numeric value. The LEAD value is ignored for floating point numbers.

**TRAIL**
The sign is placed after the numeric value. The TRAIL value is ignored for floating point numbers.

The default value for where to position the sign is LEAD.

_separator_
Specify one of the following values for the decimal separator:

- Use a period (.) as the decimal separator.
- Use a comma (,) as the decimal separator.

The default value -LEAD, which means that the sign is printed before the numeric value, the sign is shown only for negative values, and the period is used as the decimal separator.

The corresponding SYSIN parameter is OPTIONS PIC.

In previous releases of DB2 HPU, the name of this parameter was VUU018/ULPIC.

**Decimal picture, format VARIABLE (VUU018/ULPIC)**
This parameter is optional. It specifies the numeric data display format.

Specify a value in the following format: *sign*positionseparator.

**sign**
Specify one of the following values to print the sign:

+ The plus sign (+) is used for positive values.
- The minus sign (-) is used for negative values.

P The padding character is used for positive values, and the minus sign (-) is used for negative values.

The default value for specifying the rules for printing is the minus sign.

**position**
Specify one of the following values to position the sign:

**LEAD**
The sign is placed in front of the numeric value. The LEAD value is ignored for floating point numbers.

**TRAIL**
The sign is placed after the numeric value. The TRAIL value is ignored for floating point numbers.

The default value for where to position the sign is LEAD.

**separator**
Specify one of the following values for the decimal separator:

- Use a period (.) as the decimal separator.
- Use a comma (,) as the decimal separator.
The default value -LEAD., which means that the sign is printed before the numeric value, the sign is shown only for negative values, and the period is used as the decimal separator.

The corresponding SYSIN parameter is OPTIONS PIC.

In previous releases of DB2 HPU, the name of this parameter was VUU018/ULPIC.

Decimal picture, format EXTERNAL (VUU018/ULPIC)

This parameter is optional. It specifies the numeric data display format.

Specify a value in the following format: signpositionseparator.

sign
Specify one of the following values to print the sign:

+ The plus sign (+) is used for positive values.
- The minus sign (-) is used for negative values.
P The padding character is used for positive values, and the minus sign (-) is used for negative values.

The default value for specifying the rules for printing is the minus sign.

position
Specify one of the following values to position the sign:

LEAD The sign is placed in front of the numeric value. The LEAD value is ignored for floating point numbers.

TRAIL The sign is placed after the numeric value. The TRAIL value is ignored for floating point numbers.

The default value for where to position the sign is LEAD.

separator
Specify one of the following values for the decimal separator:

. Use a period (.) as the decimal separator.
, Use a comma (,) as the decimal separator.

The default value -LEAD., which means that the sign is printed before the numeric value, the sign is shown only for negative values, and the period is used as the decimal separator.

The corresponding SYSIN parameter is OPTIONS PIC.

In previous releases of DB2 HPU, the name of this parameter was VUU018/ULPIC.

Display format for numeric values, format USER (VUU032/ULMASK)

This parameter is optional. It specifies the display format for numeric values (zero and separator).

The value of this parameter consists of four separate columns:

- The Left padding column indicates whether the number is padded on the left with nonsignificant zeroes to fill up the output field. The sign character is added to the left of these zeroes.
• The Left zero column indicates whether a zero is placed to the left of the
decimal separator when the value is 0.
• The Decimal separator column indicates whether the decimal separator is
displayed. The Decimal separator column applies only to decimal data. The
decimal separator is never displayed for SMALLINT or INTEGER values.
• The Right padding column indicates whether the number is padded on the
right of the decimal separator with zeroes, up to the number of digits of the
decimal scale.

**Important:**
1. The ULMASK variable has no impact on the formatting of FLOAT values.

<p>| Table 3. Nonsignificant zero values for DECIMAL and SMALLINT/INTEGER |

For examples of the effect of using ULMASK, see the *IBM DB2 High
Performance Unload for z/OS V4.2 User's Guide*.

The following example shows how to specify a ULMASK value for the USER
format:

00.0

The default value when a LIKE value is used to force conversion to a CHAR,
an INTO clause, or a REFORMAT clause is *. *

The corresponding SYSIN parameter is OPTIONS PIC.

In previous releases of DB2 HPU, the name of this parameter was
VUU032/ULMASK.

**Display format for numeric values, format DSNTIAUL (VUU032/ULMASK)**

This parameter is optional. It specifies the display format for numeric values
(zero and separator).

The value of this parameter consists of four separate columns:
- The Left padding column indicates whether the number is padded on the left with nonsignificant zeroes to fill up the output field. The sign character is added to the left of these zeroes.
- The Left zero column indicates whether a zero is placed to the left of the decimal separator when the value is 0.
- The Decimal separator column indicates whether the decimal separator is displayed. The Decimal separator column applies only to decimal data. The decimal separator is never displayed for SMALLINT or INTEGER values.
- The Right padding column indicates whether the number is padded on the right of the decimal separator with zeroes, up to the number of digits of the decimal scale.

**Important:**
1. The ULMASK variable has no impact on the formatting of FLOAT values.

*Table 4. Nonsignificant zero values for DECIMAL and SMALLINT/INTEGER*

</tbody>
</table>

For examples of the effect of using ULMAK, see the IBM DB2 High Performance Unload for z/OS V4.2 User's Guide.
The following example shows how to specify a ULMASK value for the USER format:
00.0

The default value when a LIKE value is used to force conversion to a CHAR, an INTO clause, or a REFORMAT clause is **.*
The corresponding SYSIN parameter is OPTIONS PIC.

In previous releases of DB2 HPU, the name of this parameter was VUU032/ULMASK.

**Options for global LOAD statement (VUU019/ULOPTLDT)**
This parameter is optional. It defines the parameters of the LOAD statement that were generated at the table space level.

Enclose all sub-parameters in parentheses, as shown in the following example:
SORTDEVT(SYSDA) SORTNUM(32)

To generate a parenthesis in the LOADDDN, include two parentheses in this parameter, as shown in the following statement:
(ENFORCE((NO)),LOG(NO),COPYDDN((SYSCOPY)))

This statement generates this option in the LOAD statement:
ENFORCE(NO) LOG NO COPYDDN(SYSCOPY)

To code the load options on several lines, follow these rules:
- Use a continuation comma at the end of each line.
- Begin the first string with a left parenthesis, and code the corresponding right parenthesis only on the last line used.

The following parameters are valid. If you code a parameter that is not in this list, it is not controlled, and it is copied in the generated LOAD SYSIN.
- COPYDDN
- DISCARDDN
- DISCARDS
- ENFORCE(CONSTRAINTS/NO)
- INDDN
- KEEPDICTIONARY
- LOG(YES/NO)
- RECOVERYDDN
- REPLACE
- RESUME(YES|NO)
- SORTDEVT
- SORTKEYS
- SORTNUM
- PARALLEL or PARALLEL (num-subtask) where num-subtask specifies the maximum number of sub-tasks that are to be processed in parallel by the LOAD utility. The value must be an integer between 0 and 32767, inclusive.

**Important:** If you specify the SORTKEYS keyword, the value that you specify is substituted with a value that is calculated according to the number of unloaded records, except when you run DB2 HPU in EXECUTE NO mode. When you run DB2 HPU in EXECUTE NO mode, the &SORTKEYS variable is replaced with 0.
If you code a parameter that is not in the previous list, it will not be controlled, and will only be copied in the generated LOAD SYSIN.

When the output file is a spanned file, NUMRECS is always generated in the SYSIN for the LOAD utility, therefore the SORTKEYS parameter is not taken into account.

The default value is (LOG (NO), ENFORCE(NO)).

In previous releases of DB2 HPU, the name of this parameter was VUU019/ULOPTLDT.

Options of partition LOAD statement (VUU020/ULOPTLDP)
This parameter is optional. Defines the parameters of the LOAD statement that was generated at the partition level.

To code the load options on several lines, follow these rules:
- Use a continuation comma at the end of each line.
- Begin the first string with a left parenthesis, and code the corresponding right parenthesis only on the last line used.

The following parameters are accepted:
- RESUME(YES | NO)
- REPLACE
- KEEPDICTIONARY

The default value is (RESUME(YES)).

In previous releases of DB2 HPU, the name of this parameter was VUU020/ULOPTLDP.

Options of the table LOAD statement (VUU070/ULOPTLDP)
This parameter is optional. Defines the parameters of the LOAD statement to be generated at the table level.

To code the load options on several lines, follow these rules:
- Use a continuation comma at the end of each line.
- Begin the first string with a left parenthesis, and code the corresponding right parenthesis only on the last line used.

The following parameters are accepted:
- NUMREC(&NUMREC): the number of unloaded records is specified as the operand of the NUMRECS options written in the generated LOAD statement
- NUMRECS(integer): the specified integer value is used as the operand of the NUMRECS options written in the generated LOAD statement.

If you code a parameter that is not in the above, it will not be controlled and will only be copied in the generated LOAD SYSIN as specified.

The default value is (NUMRECS(&NUMRECS)).

In previous releases of DB2 HPU, the name of this parameter was VUU020/ULOPTLDP.

Position for NULL indicator, format USER (VUU022/NULLPOS)
This parameter is optional. It specifies the position of the NULL indicator within the DB2 HPU output data sets.

Specify one of the following values:

**AFTER**
The NULL indicator will be set after the column data.
**BEFORE**

The NULL indicator will be set before the column data.

The default value is BEFORE.

The corresponding SYSIN parameter is OPTIONS NULLPOS.

In previous releases of DB2 HPU, the name of this parameter was VUU022/NULLPOS.

**Position for NULL indicator, format DSNTIAUL (VUU022/NULLPOS)**

This parameter is optional. It specifies the position of the NULL indicator within the DB2 HPU output data sets.

Specify one of the following values:

**AFTER**

The NULL indicator will be set after the column data.

**BEFORE**

The NULL indicator will be set before the column data.

The default value is BEFORE.

The corresponding SYSIN parameter is OPTIONS NULLPOS.

In previous releases of DB2 HPU, the name of this parameter was VUU022/NULLPOS.

**Position for NULL indicator, format VARIABLE (VUU022/NULLPOS)**

This parameter is optional. It specifies the position of the NULL indicator within the DB2 HPU output data sets.

Specify one of the following values:

**AFTER**

The NULL indicator will be set after the column data.

**BEFORE**

The NULL indicator will be set before the column data.

The default value is BEFORE.

The corresponding SYSIN parameter is OPTIONS NULLPOS.

In previous releases of DB2 HPU, the name of this parameter was VUU022/NULLPOS.

**Position for NULL indicator, format EXTERNAL (VUU022/NULLPOS)**

This parameter is optional. It specifies the position of the NULL indicator within the DB2 HPU output data sets.

Specify one of the following values:

**AFTER**

The NULL indicator will be set after the column data.

**BEFORE**

The NULL indicator will be set before the column data.

The default value is BEFORE.

The corresponding SYSIN parameter is OPTIONS NULLPOS.

In previous releases of DB2 HPU, the name of this parameter was VUU022/NULLPOS.
Use the same DDN for UNLDDN, OUTDDN, and LOADDN (VUU029/UNLDDDN)

This parameter is optional. Use this parameter to prevent the use of the same DDN for UNLDDN, OUTDDN, and LOADDN.

Specify one of the following values:

YES

If you use the same DDN in a single SELECT statement with the keywords UNLDDN, OUTDDN, and LOADDN, DB2 HPU issues error INZU124E.

NO

An error is not issued when you use the same DDN in a single SELECT statement with the keywords UNLDDN, OUTDDN, and LOADDN.

The default value is NO.

In previous releases of DB2 HPU, the name of this parameter was VUU029/UNLDDDN.

DATE/TIME delimiter option (VUU031/DTDELIM)

This parameter is optional. It applies to FORMAT DELIMITED to delimit the column types DATE, TIME, and TIMESTAMP in the output data set.

Specify one of the following values:

YES

Column types DATE, TIME, and TIMESTAMP are delimited by the column delimiter that is specified by the option DELIM literal.

NO

If the NULL DELIM option is used in FORMAT DELIMITED, this parameter will not apply to the DATE, TIME, and TIMESTAMP columns.

The default value is NO.

In previous releases of DB2 HPU, the name of this parameter was VUU031/DTDELIM.

NULL DATE/TIME delimiter option (VUU043/DTNULDLM)

This parameter is optional. Specifies that the NULL DELIM option of FORMAT DELIMITED should also be used for DATE, TIME, and TIMESTAMP columns.

This parameter is used only when PARMLIB variable VUU031/DTDELIM is set to YES.

YES

If the NULL DELIM option is used in FORMAT DELIMITED, it will also apply to the DATE, TIME, and TIMESTAMP columns.

NO

If the NULL DELIM option is used in FORMAT DELIMITED, it will not apply to the DATE, TIME, and TIMESTAMP columns.

The default value is NO.

In previous releases of DB2 HPU, the name of this parameter was VUU043/DTNULDLM.

Technique to generate SYSIN for identity column (VUU058/ULIDENT)

This parameter is optional. It specifies the technique to be used when generating the load SYSIN for identity columns that are defined as GENERATED ALWAYS.

This parameter applies only to natively processed SELECT statements.

Unsupported SELECT statements and SELECT statements that are processed with the DB2 FORCE option are ignored. In this case, the IGNOREFIELDS and IDENTITYOVERRIDE keywords are not generated.
Specify one of the following values:

**IGNORE**

The load generates the column data. The generated load control statement contains the combination of IGNOREFIELDS keyword and a dummy field name for the identity column.

**OVERRIDE**

The unloaded data is loaded into the identity column. The IDENTITYOVERRIDE keyword is added to the load control statement, and the exact name of the identity column is kept. This option is available for DB2 Version 9 and later releases. For earlier versions of DB2, the IGNORE option is used.

The default value is IGNORE.

In previous releases of DB2 HPU, the name of this parameter was VUU058/ULIDENT.

**Positive sign for zoned-decimal numeric values (VUU037/ULSIGZ)**

This parameter is optional. It specifies the positive sign for decimal zoned values in hexadecimal format. Valid values are A, B, C, D, E, and F. Each value represents the positive sign. Using this parameter helps you create a customized format that meets the requirements of the programs that process the unloaded data.

The default value is C.

In previous releases of DB2 HPU, the name of this parameter was VUU037/ULSIGZ.

**Positive sign for date-time packed values (VUU038/ULSIGDTP)**

This parameter is optional. It specifies the positive sign for date- and time-packed values. Valid values are A, B, C, D, E, and F. Each value represents the positive sign. Using this parameter helps you create a customized format that meets the requirements of the programs that process the unloaded data.

The default value is F.

In previous releases of DB2 HPU, the name of this parameter was VUU038/ULSIGDTP.

**Truncate variable records exceeding 32756 (VUU040/ULTR32K)**

This parameter is optional. Specifies whether DB2 HPU will truncate the variable records that exceed the physical limit of 32756.

Specify one of the following values:

**YES**

The output file record format is variable, and the LRECL is greater than 32756 (LRECL > 32756). LRECL is truncated to 32756, and message INZU297I is issued.

**NO**

The output file record format is fixed, and the LRECL is greater than 32756 (LRECL > 32756). Processing ends, and message INZU298E is issued.

The default value is NO.

In previous releases of DB2 HPU, the name of this parameter was VUU040/ULTR32K.
Default output format for a logical unload (VUU045/ULFORMAT)
This parameter is optional. It specifies the value of the output format when the
FORMAT parameter is not specified in the SYSIN for a SELECT statement.

This parameter applies only to DB2 HPU syntax.

Attention: Changing this value in the PARMLIB will affect existing
production jobs that do not specify the FORMAT parameter. Use caution when
changing the value of this parameter in the PARMLIB.

Specify one of the following values:

**DSNTIAUL**
Specifies that the default output format for SELECT statements is FORMAT
VARIABLE. This format is the default value.

**STRICT**
Use this value to unload data in the same format that the DSNTIAUL
program produces. DSNTIAUL STRICT affects the formatting of
constant character strings that are specified in SELECT statements.

Specifying STRICT in VUU045/ULFORMAT overrides the value of
DSNTIAUL STRICT in the PARMLIB variable ULOPTNS. If STRICT is
not specified in VUU045/ULFORMAT, the content of the PARMLIB
variable ULOPTNS is used.

**Important:** FORMAT DSNTIAUL STRICT applies only to DB2 HPU
syntax.

**DELIMITED**
Specifies that the default output format for SELECT statements is FORMAT
DELIMITED.

**SEP=*val* | BLANK**
Specifies the separator character, *val*, to separate fields in the output
data set. *val* can be specified in character ('c') or hexadecimal ('X'hh')
format. Values that are specified in hexadecimal are not converted in
CCSID conversion. Values that are specified in character are converted,
if necessary, into the output CCSID.

Use BLANK to specify a space character. BLANK is the default value
for SEP.

**DELIM=*val* | BLANK | NONE**
Specifies the delimiter character, *val*, to be used to enclose CHAR,
VARCHAR, GRAPHIC, and VARGRAPHIC fields in the output data
set. *val* can be specified in character ('c') or hexadecimal ('X'hh') format.
Values that are specified in hexadecimal are not converted in CCSID
conversion. Values that are specified in character are converted, if
necessary, into the output CCSID.

**BLANK**
Specifies a space character.

**NONE**
Specifies that you do not want to use a delimiter.

The default value for the delimiter is NONE.

**NULLDELIM**
Specifies that null values are not enclosed by the delimiter character
that is specified by the *val* of DELIM.
The DELIM and NULL DELIM keyword can also apply to DATE, TIME, TIMESTAMP format depending on the settings of VUU043/DTNULDLI.

**VARIABLE**

Specifies that the default output format for SELECT statements is FORMAT VARIABLE.

**ALL**

If the column that was selected last is variable, the output data set is VB, and this last column is written on its effective length. The effective length is the actual length of the data that is contained in a column that has a variable type. Both length bytes precede the column.

**END**

All the variable columns are written by using their actual length.

The default value is END if only VARIABLE is specified.

**EXTERNAL**

Specifies that the default output format for SELECT statements is FORMAT EXTERNAL.

**USER**

Specifies that the default output format for SELECT statements is FORMAT USER.

In previous releases of DB2 HPU, the name of this parameter was VUU045/ULFORMAT.

**Size of the autotag in the output file (VUU046/ULAUTAG)**

This parameter is optional. Use this parameter to specify a number for the value of the autotag that is generated in the output file. It applies only to DB2 HPU syntax, and it applies to all output formats.

Valid values are 0 - 8.

The default value is 0. When the default value is specified, an autotag is not generated.

The corresponding SYSIN parameter is OPTIONS AUTOTAG.

**Attention:** Changing this value in the PARMLIB will affect existing production jobs. Use caution when you change this value.

In previous releases of DB2 HPU, the name of this parameter was VUU046/ULAUTAG.

**Full compatibility of LOAD statement with DB2 LOAD (VUU054/CTRLLIBM)**

This parameter is optional. It specifies whether the LOAD statement that is generated by DB2 HPU must be fully compatible with the DB2 LOAD utility.

Valid values are YES and NO.

When this parameter is set to YES, additional controls are made when the DELIMITED format is requested, and the LOAD statement is generated only if it is compatible with the DB2 LOAD utility.

In previous releases of DB2 HPU, the name of this parameter was VUU054/CTRLLIBM.
Delimiter for external date, format USER (VU055/DATEDEL)

This parameter is optional. It specifies the default delimiter that is used in external date representations.

Specify one of the following values:

'c'

The specified value must be in character format, coded between single quotation marks, and one byte long.

BLANK

Specifies that a space character is used as the default delimiter for external date representation. By default, this variable applies to FORMAT USER. It can be used to change the default value of the delimiter for date external representation for any format by using the syntax for defining formatting options for each output format.

The default value is '\'.

The corresponding SYSIN parameter is OPTIONS DATEDELIM.

In previous releases of DB2 HPU, the name of this parameter was VUU055/DATEDEL.

Delimiter for external date, format DSNTIAUL (VU055/DATEDEL)

This parameter is optional. It specifies the default delimiter that is used in external date representations.

Specify one of the following values:

'c'

The specified value must be in character format, coded between single quotation marks, and one byte long.

BLANK

Specifies that a space character is used as the default delimiter for external date representation. By default, this variable applies to FORMAT USER. It can be used to change the default value of the delimiter for date external representation for any format by using the syntax for defining formatting options for each output format.

The default value is '\'.

The corresponding SYSIN parameter is OPTIONS DATEDELIM.

In previous releases of DB2 HPU, the name of this parameter was VUU055/DATEDEL.

Delimiter for external date, format DELIMITED (VU055/DATEDEL)

This parameter is optional. It specifies the default delimiter that is used in external date representations.

Specify one of the following values:

'c'

The specified value must be in character format, coded between single quotation marks, and one byte long.

BLANK

Specifies that a space character is used as the default delimiter for external date representation. By default, this variable applies to FORMAT USER. It
can be used to change the default value of the delimiter for date external representation for any format by using the syntax for defining formatting options for each output format.

The default value is '‐'.
The corresponding SYSIN parameter is OPTIONS DATEDELIM.
In previous releases of DB2 HPU, the name of this parameter was VUU055/DATEDEL.

**Delimiter for external date, format VARIABLE (VU055/DATEDEL)**
This parameter is optional. It specifies the default delimiter that is used in external date representations.

Specify one of the following values:
'c'
The specified value must be in character format, coded between single quotation marks, and one byte long.

**BLANK**
Specifies that a space character is used as the default delimiter for external date representation. By default, this variable applies to FORMAT USER. It can be used to change the default value of the delimiter for date external representation for any format by using the syntax for defining formatting options for each output format.

The default value is '‐'.
The corresponding SYSIN parameter is OPTIONS DATEDELIM.
In previous releases of DB2 HPU, the name of this parameter was VUU055/DATEDEL.

**Delimiter for external date, format EXTERNAL (VU055/DATEDEL)**
This parameter is optional. It specifies the default delimiter that is used in external date representations.

Specify one of the following values:
'c'
The specified value must be in character format, coded between single quotation marks, and one byte long.

**BLANK**
Specifies that a space character is used as the default delimiter for external date representation. By default, this variable applies to FORMAT USER. It can be used to change the default value of the delimiter for date external representation for any format by using the syntax for defining formatting options for each output format.

The default value is '‐'.
The corresponding SYSIN parameter is OPTIONS DATEDELIM.
In previous releases of DB2 HPU, the name of this parameter was VUU055/DATEDEL.

**Delimiter in external time, format USER (VUU056/TIMEDEL)**
This parameter is optional. It specifies the default delimiter that will be used in external time representations.
The specified value must be in character format, coded between single quotation marks, and one byte long.

**BLANK**

Specifies that a space character will be used as the default delimiter for external time representation.

The default value is ".".

The corresponding SYSIN parameter is OPTIONS TIMEDELIM.

In previous releases of DB2 HPU, the name of this parameter was VUU056/TIMEDEL.

**Delimiter in external time, format DSNTIAUL (VUU056/TIMEDEL)**

This parameter is optional. It specifies the default delimiter that will be used in external time representations.

The specified value must be in character format, coded between single quotation marks, and one byte long.

**BLANK**

Specifies that a space character will be used as the default delimiter for external time representation.

The default value is ".".

The corresponding SYSIN parameter is OPTIONS TIMEDELIM.

In previous releases of DB2 HPU, the name of this parameter was VUU056/TIMEDEL.

**Delimiter in external time, format DELIMITED (VUU056/TIMEDEL)**

This parameter is optional. It specifies the default delimiter that will be used in external time representations.

The specified value must be in character format, coded between single quotation marks, and one byte long.

**BLANK**

Specifies that a space character will be used as the default delimiter for external time representation.

The default value is ".".

The corresponding SYSIN parameter is OPTIONS TIMEDELIM.

In previous releases of DB2 HPU, the name of this parameter was VUU056/TIMEDEL.

**Delimiter in external time, format VARIABLE (VUU056/TIMEDEL)**

This parameter is optional. It specifies the default delimiter that will be used in external time representations.

The specified value must be in character format, coded between single quotation marks, and one byte long.

**BLANK**

Specifies that a space character will be used as the default delimiter for external time representation.
The default value is `\'\'.

The corresponding SYSIN parameter is OPTIONS TIMEDELIM.

In previous releases of DB2 HPU, the name of this parameter was VUU056/TIMEDEL.

**Delimiter in external time, format EXTERNAL (VUU056/TIMEDEL)**

This parameter is optional. It specifies the default delimiter that will be used in external time representations.

`'c'

The specified value must be in character format, coded between single quotation marks, and one byte long.

**BLANK**

Specifies that a space character will be used as the default delimiter for external time representation.

The default value is `\'\'.

The corresponding SYSIN parameter is OPTIONS TIMEDELIM.

In previous releases of DB2 HPU, the name of this parameter was VUU056/TIMEDEL.

**Options apply to all formats (VUU057/OPALLFMT)**

This parameter is optional. It specifies whether the formatting options that are specified in SYSIN in the OPTIONS block at the GLOBAL level or the UNLOAD level apply only to FORMAT USER or to all output formats.

VUU057/OPALLFMT applies to the following SYSIN parameters of the OPTIONS block:

- NULL
- DATE
- TIME
- TIMESTAMP
- PIC
- DATEDELIM
- TIMEDELIM
- NULLID
- NULLPOS
- NULLPAD
- PADDING
- TRIM

Specify one of the following values:

**NO**

The SYSIN parameters in the previous list apply only to FORMAT USER when they are specified at the GLOBAL level or at the UNLOAD level.

**YES**

The SYSIN parameters in the previous list apply to all output formats when they are specified at the GLOBAL level or at the UNLOAD level.

**Attention:** Specifying YES for this PARMLIB variable might affect the output data that is generated by existing production jobs. Change this variable to YES only after you have verified that existing DB2 HPU production jobs will not be affected by the change.
When the SYSIN parameters in the previous list are specified at the SELECT level (after the OUTDDN keyword), they always apply to all output formats. In this case, the value of OPALLFMT is ignored.

The default value is NO.

In previous releases of DB2 HPU, the name of this parameter was VUU057/OPALLFMT.

**Trim the trailing blanks, format USER (VUU059/ULTRIM)**

This parameter is optional. Use it to specify whether DB2 HPU will remove the trailing blanks for character data that is unloaded into a variable length field. It applies to CHAR, VARCHAR, GRAPHIC, VARGRAPHIC, CLOB, and DBCLOB output fields. However, it does not apply to numeric external data.

Specify one of the following values:

**NO**  Trailing blanks are not removed from variable length strings.

**YES**  Trailing blanks are removed when data is unloaded into VARCHAR, VARGRAPHIC output fields, or CLOB, and DBCLOB output field except if SPANNED YES is requested. The length of the output field is adjusted to match the effective number of characters that are written.

The default value is NO.

In previous releases of DB2 HPU, the name of this parameter was VUU059/ULTRIM.

**Trim the trailing blanks, format DSNTIAUL (VUU059/ULTRIM)**

This parameter is optional. Use it to specify whether DB2 HPU will remove the trailing blanks for character data that is unloaded into a variable length field. It applies to CHAR, VARCHAR, GRAPHIC, VARGRAPHIC, CLOB, and DBCLOB output fields. However, it does not apply to numeric external data.

Specify one of the following values:

**NO**  Trailing blanks are not removed from variable length strings.

**YES**  Trailing blanks are removed when data is unloaded into VARCHAR, VARGRAPHIC output fields, or CLOB, and DBCLOB output field except if SPANNED YES is requested. The length of the output field is adjusted to match the effective number of characters that are written.

The default value is NO.

In previous releases of DB2 HPU, the name of this parameter was VUU059/ULTRIM.

**Trim the trailing blanks, format DELIMITED (VUU059/ULTRIM)**

This parameter is optional. Use it to specify whether DB2 HPU will remove the trailing blanks for character data that is unloaded into a variable length field. It applies to CHAR, VARCHAR, GRAPHIC, VARGRAPHIC, CLOB, and DBCLOB output fields. However, it does not apply to numeric external data.

Specify one of the following values:

**NO**  Trailing blanks are not removed from variable length strings.

**YES**  Trailing blanks are removed when data is unloaded into VARCHAR, VARGRAPHIC output fields, or CLOB, and DBCLOB output field except if
SPANNED YES is requested. The length of the output field is adjusted to match the effective number of characters that are written.

The default value is NO.

In previous releases of DB2 HPU, the name of this parameter was VUU059/ULTRIM.

**Trim the trailing blanks, format VARIABLE (VUU059/ULTRIM)**

This parameter is optional. Use it to specify whether DB2 HPU will remove the trailing blanks for character data that is unloaded into a variable length field. It applies to CHAR, VARCHAR, GRAPHIC, VARGRAPHIC, CLOB, and DBCLOB output fields. However, it does not apply to numeric external data.

Specify one of the following values:

- NO  Trailing blanks are not removed from variable length strings.
- YES  Trailing blanks are removed when data is unloaded into VARCHAR, VARGRAPHIC output fields, or CLOB, and DBCLOB output field except if SPANNED YES is requested. The length of the output field is adjusted to match the effective number of characters that are written.

The default value is NO.

In previous releases of DB2 HPU, the name of this parameter was VUU059/ULTRIM.

**Trim the trailing blanks, format EXTERNAL (VUU059/ULTRIM)**

This parameter is optional. Use it to specify whether DB2 HPU will remove the trailing blanks for character data that is unloaded into a variable length field. It applies to CHAR, VARCHAR, GRAPHIC, VARGRAPHIC, CLOB, and DBCLOB output fields. However, it does not apply to numeric external data.

Specify one of the following values:

- NO  Trailing blanks are not removed from variable length strings.
- YES  Trailing blanks are removed when data is unloaded into VARCHAR, VARGRAPHIC output fields, or CLOB, and DBCLOB output field except if SPANNED YES is requested. The length of the output field is adjusted to match the effective number of characters that are written.

The default value is NO.

In previous releases of DB2 HPU, the name of this parameter was VUU059/ULTRIM.

**String constant is unloaded as CHAR/VARCHAR data types (VUU064/STRNGCST)**

This parameter is optional. It specifies whether string constants in the SELECT statements are handled as CHAR or VARCHAR data when the SELECT statement is processed in native mode.

**CHAR**

The string constants are handled as CHAR data unless the DSNTIAUL STRICT format is requested either by specifying DSNTIAULSTRICT(NO) as a subparameter of the ULOPTNS parameter or by using the FORMAT DSNTIAUL STRICT option in the UNLOAD command. When you specify CHAR, the output for
expressions that have string constants might depend on whether the unload is performed in native or in SQL mode.

**VARCHAR**

The string constants are handled as VARCHAR data. When you specify VARCHAR, the output for expressions that have string constants does not depend on whether the unload is processed in native or in SQL mode. Consider specifying VARCHAR for unloads that use the DB2 YES option.

**Important:** If some of your processes use strings that are handled as CHAR data when DB2 HPU processes the unload in native mode, use the default value. Otherwise, specify VARCHAR to ensure that the output of the unload for expressions that have string constants do not depend on the processing mode of the unload.

If you want to specify VARCHAR so that string constants are processed as VARCHAR data in native mode or SQL mode but you have some jobs that expect string constants to be processed as CHAR data, consider changing the SELECT statements for these unloads by replacing any string constant `string_constant` with `CHAR(string_constant)`.

The default value is CHAR.

In previous releases of DB2 HPU, the name of this parameter was VUU064/STRNGCST.

**Manage character loss, DB2 HPU syntax (VUU071/LOSSCHAR)**

This parameter is optional. It specifies the behavior of the product when significant data from a character column is lost during unload formatting because of an INTO or REFORMAT clause and a DB2 HPU syntax is specified.

DB2 HPU considers a data loss has occurred for a character column if the data truncation removes any character that does not belong to the padded part of the character string, i.e. a sequence of padding characters that ends at the right end of the character string.

The data loss is checked for the following data types:

- CHAR
- VARCHAR
- GRAPHIC
- VARGRAPHIC
- BINARY
- VARBINARY

Specify one of the following values:

**IGNORE**
No control is done. The return code of the job is 0 unless another issue occurs.

**WARNING**
A warning message is issued for any column affected by a data loss. The return code is 4 unless another issue occurs.

**REJECT**
An error message is issued for any column affected by a data loss. The return code is 8 unless another issue occurs.

The default value is IGNORE.
The corresponding SYSIN parameter is CHARACTER_LOSS from the OPTIONS block.

**Manage character loss, UNLOAD PLUS syntax (VUU071/LOSSCHAR)**

This parameter is optional. It specifies the behavior of the product when significant data from a character column is lost during unload formatting because of an INTO or REFORMAT clause and a UNLOAD PLUS syntax is specified.

DB2 HPU considers a data loss has occurred for a character column if the data truncation removes any character that does not belong to the padded part of the character string, i.e. a sequence padding characters that ends at the right of the character string.

The data loss is checked for the following data types:
- CHAR
- VARCHAR
- GRAPHIC
- VARGRAPHIC
- BINARY
- VARBINARY

Specify one of the following values:

- **IGNORE**
  No control is done. The return code of the job is 0 unless another issue occurs.

- **WARNING**
  A warning message is issued for any column affected by a data loss. The return code is 4 unless another issue occurs.

- **REJECT**
  An error message is issued for any column affected by a data loss. The return code is 8 unless another issue occurs.

The default value is IGNORE.

The corresponding SYSIN parameter is CHARACTER_LOSS from the OPTIONS block.

**Manage character loss, FAST UNLOAD syntax (VUU071/LOSSCHAR)**

This parameter is optional. It specifies the behavior of the product when significant data from a character column is lost during unload formatting because of an INTO or REFORMAT clause and a FAST UNLOAD syntax is specified.

DB2 HPU considers a data loss has occurred for a character column if the data truncation removes any character that does not belong to the padded part of the character string, i.e. a sequence padding characters that ends at the right end of the character string.

The data loss is checked for the following data types:
- CHAR
- VARCHAR
- GRAPHIC
- VARGRAPHIC
- BINARY
- VARBINARY
Specify one of the following values:

**IGNORE**
No control is done. The return code of the job is 0 unless another issue occurs.

**WARNING**
A warning message is issued for any column affected by a data loss.
The return code is 4 unless another issue occurs.

**REJECT**
An error message is issued for any column affected by a data loss. The return code is 8 unless another issue occurs.

The default value is IGNORE.

The corresponding SYSIN parameter is CHARACTER_LOSS from the OPTIONS block.

**Manage numeric loss, DB2 HPU syntax (VUU072/LOSSNUM)**
This parameter is optional. It specifies the behavior of the product when significant data from a numeric column is lost during unload formatting (via INTO or REFORMAT clause) and a DB2 HPU syntax is specified.

DB2 HPU considers a data loss has occurred for a numeric column the numeric value has changed.

The data loss is checked for the following data types:
- SMALLINT
- INTEGER
- BIGINT
- DECIMAL

Specify one of the following values:

**IGNORE**
No control is done. The return code of the job is 0 unless another issue occurs.

**WARNING**
A warning message is issued for any column affected by a data loss.
The return code is 4 unless another issue occurs.

**REJECT**
An error message is issued for any column affected by a data loss. The return code is 8 unless another issue occurs.

The default value is IGNORE.

The corresponding SYSIN parameter is NUMERIC_LOSS from the OPTIONS block.

**Manage numeric loss, UNLOAD PLUS syntax (VUU072/LOSSNUM)**
This parameter is optional. It specifies the behavior of the product when significant data from a numeric column is lost during unload formatting (via INTO or REFORMAT clause) and an UNLOAD PLUS syntax is specified.

DB2 HPU considers a data loss has occurred for a numeric column the numeric value has changed.

The data loss is checked for the following data types:
- SMALLINT
- INTEGER
• BIGINT
• DECIMAL

Specify one of the following values:

**IGNORE**
No control is done. The return code of the job is 0 unless another issue occurs.

**WARNING**
A warning message is issued for any column affected by a data loss. The return code is 4 unless another issue occurs.

**REJECT**
An error message is issued for any column affected by a data loss. The return code is 8 unless another issue occurs.

The default value is **IGNORE**.

The corresponding SYSIN parameter is **NUMERIC_LOSS** from the **OPTIONS** block.

### Manage numeric loss, FAST UNLOAD syntax (VUU072/LOSSNUM)

This parameter is optional. It specifies the behavior of the product when significant data from a numeric column is lost during unload formatting (via INTO or REFORMAT clause) and a FAST UNLOAD syntax is specified.

DB2 HPU considers a data loss has occurred for a numeric column the numeric value has changed.

The data loss is checked for the following data types:
• SMALLINT
• INTEGER
• BIGINT
• DECIMAL

Specify one of the following values:

**IGNORE**
No control is done. The return code of the job is 0 unless another issue occurs.

**WARNING**
A warning message is issued for any column affected by a data loss. The return code is 4 unless another issue occurs.

**REJECT**
An error message is issued for any column affected by a data loss. The return code is 8 unless another issue occurs.

The default value is **IGNORE**.

The corresponding SYSIN parameter is **NUMERIC_LOSS** from the **OPTIONS** block.

### Example: Manage numeric loss, with DB2 HPU, UNLOAD PLUS, FAST UNLOAD syntaxes

Assume C1 has the INTEGER data-type and is unloaded into a SMALLINT data-type with the help of a REFORMAT clause:
• a row for which C1’s value is 100 and is unloaded without error as the value 100 is kept (not altered) in the SMALLINT data-type output.
• a row for which C1’s value is 1,000,000 (the internal representation is 
  x’000F4240’) is processed as follows according to the parameter value:
  - it is unloaded with C1 field containing the value 16960 (the internal 
    representation is x’4240’) without any message related to data loss if 
    IGNORE is specified,
  - it is unloaded with C1 field containing the value 16960 (with internal 
    representation is x’4240’) with a warning message if WARNING is 
    respected,
  - it is rejected with an error message if REJECT is specified.

**Error message limit, DB2 HPU parameters (VUU073/MAXERR)**

This parameter is optional. It specifies the maximum number of messages that 
are issued if, while processing an unload requested via the DB2 HPU syntax, 
DB2 HPU encounters an error (conversion, formatting...) while unloading the 
rows of a table. When the limit is reached, the process stops and the return 
code is set to 8. Use this parameter to limit the number of messages that are 
written into the spool.

Valid values are: 0-2147483647 (0 means ‘no limit’).

The default value is 0.

The corresponding SYSIN parameter is MAXERR.

**Error message limit, UNLOAD PLUS syntax (VUU073/MAXERR)**

This parameter is optional. It specifies the maximum number of messages that 
are issued if while processing an unload requested via the UNLOAD PLUS 
syntax, DB2 HPU encounters an error (conversion, formatting...) while 
unloading the rows of a table. When the limit is reached, the process stops and 
the return code is set to 8. Use this parameter to limit the number of messages 
that are written into the spool.

Valid values are: 0-2147483647 (0 means ‘no limit’).

The default value is 0.

The corresponding SYSIN parameter is DISCARDS.

**Error message limit, FASTUNLOAD syntax (VUU073/MAXERR)**

This parameter is optional. It specifies the maximum number of messages that 
are issued if while processing an unload requested via the FASTUNLOAD 
syntax, DB2 HPU encounters an error (conversion, formatting...) while 
unloading the rows of a table. When the limit is reached, the process stops and 
the return code is set to 8. Use this parameter to limit the number of messages 
that are written into the spool.

Valid values are: 0-2147483647 (0 means ‘no limit’).

The default value is 0.

The corresponding SYSIN parameter is DISCARDS.

**DB2 HPU DB2 Administration Tool and DB2 Launchpad parameters**

The DB2 Administration Tool and DB2 Launchpad parameters section on the 
Product Parameters panel (CCQPPRD) in Tools Customizer contains the 
parameters that are required to integrate DB2 HPU with DB2 Admin.

The following list describes the DB2 HPU DB2 Administration Tool and DB2 
Launchpad parameters. The parameters are listed in the following format:
description (Vxnnnn/parameter-name)

**High-level qualifier for the DB2 Admin data sets**
This parameter is optional. It specifies the high-level qualifier of the DB2 Administration Tool libraries. This information is used by the sample programs INZADBI and INZDB2IX (in the SINZCLST library) to update the DB2 Administration Tool and the Data Management Tools Launchpad tables.

In previous releases of DB2 HPU, the name of this parameter was VUU025.

**Library which contains DB2 Admin commands tables**
This parameter is optional. It specifies the name of the library that contains the DB2 Administration Tool command tables. This information is used by the sample programs INZADBI and INZDB2IX (in the SINZCLST library) to update the DB2 Administration Tool and the DB2 Tools Launchpad tables.

In previous releases of DB2 HPU, the name of this parameter was VUU026.

**Library which contains the ADBMTI EXEC**
This parameter is optional. It specifies the name of the library that contains the ADBMTI EXEC. This information is used by the sample programs INZADBI and INZDB2IX (in the SINZSAMP library) to update the DB2 Administration Tool and the DB2 Tools Launchpad tables.

In previous releases of DB2 HPU, the name of this parameter was VUU027.

**DB2 HPU conversion parameters**
The DB2 HPU conversion parameters section on the Product Parameters panel (CCQPPRD) in Tools Customizer contains the conversion parameters that are used by DB2 HPU.

The following list describes the DB2 HPU conversion parameters. The parameters are listed in the following format:

description (Vxnnnn/parameter-name)

**Unicode Conversion Services load library (VZM006/SCUNMOD)**
This parameter is optional. It specifies the name of the IBM Conversion Service Load Library. If you want to perform conversions that imply non-SBCS CCSIDs or pairs of SBCS CCSIDs that are not supported by the SYSSTRINGS catalog table, you must first install IBM OS/390® Support for Unicode. For more information about this program, see Program Directory for z/OS Support for Unicode and z/OS Support for Unicode Using Conversion Services.

In previous releases of DB2 HPU, the name of this parameter was VZM006/SCUNMOD.

**Unicode Conversion Services technique search order (VZM007/SCUNTSO)**
This parameter is optional. It specifies a list of technique search orders to be searched for the z/OS Unicode Services. Separate each value with a comma. When a conversion between two CCSIDs is required, HPU looks for a conversion that specifies one of the listed technique search orders until it finds one valid conversion.

**Example:** SCUNTSO = ER,,RE means that DB2 HPU will for the ER technique search order, followed by the blank technique search order, and then the RE technique search order.

The default value is blank.

If DB2 Version 8 or later is installed, usually the technique search order is equal to ER.
See z/OS Support for Unicode Using Conversion Services for more information.

In previous releases of DB2 HPU, the name of this parameter was VZM007/SCUNTSO.

Unicode Conversion Services substitution character mode (VZM008/SCUNSUB)
This parameter is optional. It specifies how the UNLOAD utility manages conversions through z/OS Unicode Services.

YES Indicates that if a character in a string cannot be converted between two CCSIDs, it is replaced by the substitution character of the converter.

NO Indicates that if a character in a string cannot be converted, the conversion of all the strings fails.

The default value is YES.

In previous releases of DB2 HPU, the name of this parameter was VZM008/SCUNSUB.

DB2 HPU file management parameters
The DB2 HPU file management parameters section on the Product Parameters panel (CCQPPRD) in Tools Customizer contains the file management parameters that are used by DB2 HPU.

The following list describes the DB2 HPU file management parameters. The parameters are listed in the following format:

description (Vxxnnnn/parameter-name)

Volume name of migrated object (VZM005/INFVSMIG)
This parameter is optional. It specifies the volume name that is located in the ICF catalog for migrated files. The default value is MIGRAT, which corresponds to the value that is used by the DFSMShsm component of the IBM Data Facility Storage Management Subsystem (DFSMS).

In previous releases of DB2 HPU, the name of this parameter was VZM005/INFVSMIG.

Assignable devices number per tape unit/storage class (VZM010/TAPEUNIT)
This parameter is optional. Use this parameter to specify multiple unit names, storage class names, or both, and the number of associated devices that can be used by DB2 HPU when you request that output files be allocated on tape. DB2 HPU ensures that the maximum number of tape devices is not exceeded by automatically reducing the parallelism degree, if necessary. When the number of tape devices that are associated with a unit name or a storage class name is not specified, the value is set to 1.

This parameter does not have a default value.

The corresponding SYSIN keyword is TAPEUNIT in the GLOBAL OPTIONS block.

In previous releases of DB2 HPU, the name of this parameter was VZM010/TAPEUNIT.

Maximum number of disk units to allocate a work file (VUX010/LIMUNIT)
This parameter is optional. It specifies the maximum number of disk units to be used when DB2 HPU allocates a temporary work file. It is also taken into account to determine the number of work data sets specified as the DYNALLOC first operand of the SORT program when a DB2 HPU needs to perform a sort task.
The default value is 9.

The corresponding SYSIN keyword is LIMUNIT in the Technical Parameters options block, which can be coded in the GLOBAL OPTIONS block.

In previous releases of DB2 HPU, the name of this parameter was VUX010/LIMUNIT.

**Note:** When allocations are performed by DB2 HPU, the LIMUNIT value is used as the volume count (VOLCNT) allocation parameter unless it exceeds the maximum value accepted by the system for the device type involved. For example, if LIMUNIT is set to 255 and the works data sets are to be allocated on DASD devices for which the limit is 59, DB2 HPU allocates the work data sets with VOLCNT=59.

**Maximum size for primary allocation of a work data set (VUX019/WRKMXPR)**

This parameter is optional. It specifies the maximum size, in kilobytes, for the primary allocation of a work data set on DASD. When very large work data sets are used, the primary allocation might be distributed among several volumes according to the limit that was specified in the VUX010/LIMUNIT parameter.

**Requirement:** Regardless of the limit that was specified on the VUX010/LIMUNIT parameter, the value that you provide for the VUX019/WRKMXPR parameter must be lower than the capacity of the units that is used for these work data sets (VUM013). You must also consider that these units might be distributed among several volumes.

Valid values are 1 - 16777215.

The default value is 500000.

The corresponding SYSIN keyword is WRKMXPR in the Technical Parameters options block, which can be coded in the GLOBAL OPTIONS block.

In previous releases of DB2 HPU, the name of this parameter was VUX019/WRKMXPR.

**Note:** When DB2 HPU invokes the sort program, the number of work datasets to be used by the sort program is determined according to the following rules:

- The size of a work data set is assumed to be VUX019/WRKMXPR.
- The number of work files per allowed volume (i.e. VUX010/LIMUNIT) must not exceed 2.

These rules are implemented via the following formula: Number of work data sets = min(upper_round(2 * FILSZ * RECORD_LENGTH / WRKMXPR / 1024), 2 * LIMUNIT) where FILSZ stands for the estimated number of records to be sorted and RECORD_LENGTH for the mean value of the record length.

Although the above formula is always used to determine the allowed number of work data sets, the actual number of data sets might be lower if this calculated number exceeds the number of file the sort program can handle. For example, DFSORT V1R12.0 cannot use more than 255. Therefore, although LIMUNIT is set to a value greater than or equal to 128, which would theoretically allow the sort program, to use more than 256 work data sets, no more than 255 files will be actually used.

**DSCB model for allocation of GDS (VUX033/TMPLDSCB)**

This parameter is optional. It specifies the model data set control block (DSCB)
to use when allocating generation data sets (GDS) and when a TEMPLATE is used to allocate new generations of a generation data group (GDG).

In previous releases of DB2 HPU, the name of this parameter was VUX033/TMPLDSCB.

Volumes for allocation of temporary data sets (VUM018/WRKVOL)

This parameter is optional. It specifies the name of the volume where temporary data sets will reside.

In previous releases of DB2 HPU, the name of this parameter was VUM018/WRKVOL.

Tape unit where the work data sets must be allocated (VUA007/WRKTUNIT)

This parameter is optional. It specifies the name of the tape unit that is used to allocate temporary files.

If you use temporary files on tape, specify a tape unit or DASD device on this parameter. If you specify a DASD device, ensure that the pool of volumes that are associated with that unit has enough free space to store large data sets. If you do not specify a value, the utility allocates temporary files on the unit that is specified on the WRKUNIT parameter.

The corresponding SYSIN keyword is WRKTUNIT of the Technical Parameters options block, which can be coded in the GLOBAL OPTIONS block.

In previous releases of DB2 HPU, the name of this parameter was VUA007/WRKTUNIT.

Maximum size for work data set on DASD (VUX016/WRKUNTSW)

This parameter is optional. It specifies a threshold size (in kilobytes) for work data sets. All work data sets that exceed this threshold size will be allocated on the unit that is specified on the VUA007/WRKTUNIT parameter.

The corresponding SYSIN keyword is WRKUNTSW in the Technical Parameters options block, which can be coded in the GLOBAL OPTIONS block.

In previous releases of DB2 HPU, the name of this parameter was VUX016/WRKUNTSW.

Maximum number of unit for tape temporary data set (VUX017/MAXTUNIT)

This parameter is optional. It specifies the maximum number of tape units that are provided for work data sets that are used by a DB2 HPU job.

Valid values are 1 - 255.

The default value is 2.

The corresponding SYSIN keyword is MAXTUNIT in the Technical Parameters options block, which can be coded in the GLOBAL OPTIONS block.

In previous releases of DB2 HPU, the name of this parameter was VUX017/MAXTUNIT.

Number of volumes for temporary data set on tape (VUX032/WRKTVCNT)

This parameter is optional. It specifies the number of volumes to use for temporary data sets that are allocated on tape. Specifying 0 indicates that no VOLCOUNT parameter will be used for allocating tape files. In this case, up to five volumes are used.

Valid values are 0 - 255.

The default value is 0.
The corresponding SYSIN keyword is WRKTVCNT in the Technical Parameters options block, which can be coded in the GLOBAL OPTIONS block.

In previous releases of DB2 HPU, the name of this parameter was VUX032/WRKTVCNT.

**BUFNO for sequential QSAM (VUM022/QSBUFNO)**

This parameter is optional. It specifies the number of data buffers for sequential QSAM (the BUFNO parameter of the DCB for QSAM).

Valid values are 1 - 255.

The default value is 60.

In previous releases of DB2 HPU, the name of this parameter was VUM022/QSBUFNO.

**BUFND for sequential VSAM (VUM023/VSBUFND)**

This parameter is optional. It specifies the number of data buffers for sequential VSAM (the BUFND parameter of the ACB for VSAM).

Note: Specifying a large value might increase the amount of memory that DB2 HPU requires.

Valid values are 0 - 65535.

The default value is 360.

In previous releases of DB2 HPU, the name of this parameter was VUM023/VSBUFND.

**DB2 HPU reporting parameters**

The DB2 HPU reporting parameters section on the Product Parameters panel (CCQPPRD) in Tools Customizer contains the reporting parameters that are used by DB2 HPU.

The following list describes the reporting parameters. The parameters are listed in the following format:

\[ \text{description \ (Vvxxnnnn/parameter-name)} \]

**List of system codes for which no dump is produced (VZM009)**

This parameter is optional. It defines a list of system codes for which no dump is produced if an abend occurs during execution of DB2 HPU. You can specify up to eight lines. Each line can contain up to eight values. Separate each value by a comma.

After changing the content of this variable, you must regenerate the installation job related to the INZZSCOD template to activate the change.

The list can contain specific system codes that are coded on three hexadecimal digits or generic system codes that begin with X and include all the system codes for the number that follows it. For example, 0c1 is a specific system code, and X78 is a generic system code that includes all system codes that end with 78 (B78, D78, E78, and so on).

The default value is X22, X06, X37, 913, X78, X0A.

In previous releases of DB2 HPU, the name of this parameter was VZM009.

**Generate a tape usage report in SYSPRINT (VZM011/TAPERPT)**

This parameter is optional. Use it to specify whether to generate a report about the tape usage. The report displays the data set names (DSN) and their positions on the tape (FILESEQ) for each volume that is used.
Specify one of the following values:

YES  The tape usage report is generated.
NO   The tape usage report is not generated.

The default value is NO.

In previous releases of DB2 HPU, the name of this parameter was VZM011/TAPERPT.

**Maximum number of messages for row structure errors (VUX018/LDSERRLM)**

This parameter is optional. It specifies the maximum number of messages that are issued if DB2 HPU encounters a row structure error while reading the rows of a table space. Use this parameter to limit the number of messages that are written into the spool.

Valid values are 0 - 2147483647.

**Important:** Specifying a large number of records might increase the amount of storage that DB2 HPU requires.

This parameter does not have a default value.

In previous releases of DB2 HPU, the name of this parameter was VUX018/LDSERRLM.

**Return code for unloaded rows (VUU024/UNLZLRC)**

This parameter is optional. It specifies the return code that applies when no rows are unloaded by at least one of the SELECT statements of the UNLOAD command.

Valid values are 0 - 4095.

The default value is 4.

Alteration applies only when original return code is zero unless keyword MAXRC is specified.

In previous releases of DB2 HPU, the name of this parameter was VUU024/UNLZLRC.

**Return code if an object is missing (VUU024/UNLZLRC)**

This parameter is optional. It specifies the return code that applies when an object included in a LIST TDEF does not exist, or when a LISTDEF expands to contain no objects. When this parameter is not specified, no specific return code applies for this situation.

Valid values are 1 - 4095.

There is no default value.

Alteration applies only when original return code is zero unless keyword MAXRC is specified.

In previous releases of DB2 HPU, the name of this parameter was VUU024/UNLZLRC.

**Return code if zero line is unloaded (VUU024/UNLZLRC)**

This parameter is optional. It specifies the return code when a LISTDEF clause returns no objects. When this parameter is not specified, no specific return code applies for this situation.

Valid values are 1 - 4095.

There is no default value.
Alteration applies only when original return code is zero unless keyword MAXRC is specified.

In previous releases of DB2 HPU, the name of this parameter was VUU024/UNLZLRC.

**MAXRC alteration return code (VUU024/UNLZLRC)**

This parameter is optional. When MAXRC is not specified, the original return code can be altered only when it is 0. When MAXRC is specified, it can also be altered when its value is 1 - 8.

**Frequency to display information messages (VUU050/ULFRQMSG)**

This parameter is optional. It specifies that DB2 HPU issues informational messages that display the current number of unloaded rows for each output file.

n At the end of processing, DB2 HPU issues message INZX089, which indicates the total number of rows for each output file. A non-null integer value means that this message is issued for each n rows.

The default value is 0.

In previous releases of DB2 HPU, the name of this parameter was VUU050/ULFRQMSG.

**Additional parameter for information messages (VUU050/ULFRQMSG)**

This parameter is optional. It specifies interval time since the previous message was issued or since the first record was unloaded.

Specify one of the following values:

- **DELTA** Messages INZX089 and INZX090 are issued to indicate the elapsed time since the previously issued message.
- **TOTAL** Messages INZX089 and INZX090 are issued to indicate the total elapsed time since the beginning of the unload process.

TOTAL is the default when a non-null value is specified and neither DELTA nor TOTAL is specified.

TOTAL and DELTA are mutually exclusive.

The default value is TOTAL.

In previous releases of DB2 HPU, the name of this parameter was VUU050/ULFRQMSG.

**The location where DB2 HPU writes information messages (VUU051/PROCMSG)**

This parameter is optional. It specifies where to write informational messages that correspond to the unload process of the table space, image copy, or partitions and indexes.

Specify one of the following values:

- **WTO** Messages are issued as write to operator messages in the system log.
- **ddname** Messages are issued in the corresponding ddname. If the corresponding ddname is not already allocated in the JCL, it is dynamically allocated as SYSOUT=*. This ddname can be equal to SYSPRINT, in which case these messages might be mixed with other messages that DB2 HPU issues.
All messages that are issued in the output file are prefixed with the system time in \textit{hh:mm:ss} format.

The default value is WTO.

The corresponding SYSIN parameter is \texttt{OPTIONS PROCMSG}.

In previous releases of DB2 HPU, the name of this parameter was \texttt{VUU051/PROCMSG}.

\textbf{Location of messages issued for each SELECT statement (VUU052/SEMSG)}

This parameter is optional. It specifies where to write informational messages INZX089 and INZX090 that are issued for each SELECT statement.

Specify one of the following values:

\textbf{WTO}

Messages that correspond to the SELECT statements are issued as write to operator messages in the system log.

\textbf{NUMBERED}

Messages that correspond to the SELECT statements are issued in a ddname for each SELECT statement. If this ddname is not already allocated in the JCL, it is dynamically allocated as SYSSOUT=*. The format of the generated ddname is \texttt{UxxSyyyy}, where \texttt{xx} is the two-digit UNLOAD number and \texttt{yyyy} is the SELECT number for this unload.

\textbf{ddname}

Messages that correspond to the SELECT statements are issued in the corresponding ddname. If this ddname is not already allocated in the JCL, it will be dynamically allocated as SYSPRINT=*. This ddname can be equal to SYSPRINT, in which case these messages might be mixed with other messages that DB2 HPU issues.

The default value is WTO.

The corresponding SYSIN parameter is \texttt{OPTIONS SELMSG}.

In previous releases of DB2 HPU, the name of this parameter was \texttt{VUU052/SEMSG}.

\textbf{Generate a list of all OBIDs in the FIC (VUU053/OBIDRPT)}

This parameter is optional. It specifies whether to generate a list of all object IDs (OBIDs) that are found in the full image copy (FIC). It applies only when you are unloading from an image copy.

\textbf{YES}

Generates a list of all OBIDs that are found in the FIC.

\textbf{NO}

Does not generate a list of all OBIDs that are found in the FIC.

The default value is NO.

The corresponding SYSIN parameter is \texttt{OBID\_REPORT} in the COPYDDN option.

In previous releases of DB2 HPU, the name of this parameter was \texttt{VUU053/OBIDRPT}.

\textbf{Return code when the utility has switched to SQL mode (VUU069/SQLSWIRC)}

This parameter is optional. It specifies the return code that applies when the processing of a select statement has automatically switched to SQL mode when
the statement is not supported in native mode. It is not applicable when the
SQL mode is explicitly requested (e.g. DB2 HPU FORCE is specified).

Valid values are 0 - 4095.

The default value is 4.

**DB2 HPU tuning parameters**
The DB2 HPU tuning parameters section on the Product Parameters panel
(VCQPPRD) in Tools Customizer contains the tuning parameters that are used by
DB2 HPU.

The following list describes the tuning parameters. The parameters are listed in the
following format:

*description (Vxxnnnn/parameter-name)*

**Default size of the input file or object for DB2 HPU (VUX003/SIZE)**
This parameter is optional. It specifies the default number of records when
allocating the resources (work data sets and FILSZ parameter) that are required
by the SORT processing. The default value is used only when DB2 HPU is
unable to estimate the number of rows to be unloaded, which happens only in
very specific cases.

This parameter is ignored when the rows are selected by DB2. Therefore, set
VUX003/SIZE to a typical or maximum number of rows for the table spaces
that are usually processed by DB2 HPU. VUX003/SIZE is expressed as a
number of records.

Valid values are 1000 - 2147483647

**Important:** Specifying a large number of records might increase the amount of
storage that DB2 HPU requires.

The default value is 1000000 records.

In previous releases of DB2 HPU, the name of this parameter was
VUX003/SIZE.

**Minimum memory size for each sort process (VUX004/LOWMEM)**
This parameter is optional. It specifies the memory size, in bytes, below the 16
MB line that is used by the sort process. DB2 HPU considers LOWMEM only
during parallel processing. When DB2 HPU prepares to start one or more
SORT tasks (with the exception of the first SORT), it checks whether the
amount of remaining memory under the line is greater or equal to LOWMEM.

Take the following into account in order to determine the MAXSORT and
LOWDEM parameters:

1. Determine the maximum storage that is allowed for a SORT below the 16
   MB limit; this value is referred as SORTMAXMEMBELOW hereafter. For
   example, SORTMAXMEMBELOW is the value of VSCORE parameter of the
   DFSORT installation and the value of VSCORE parameter of the
   SYNCSORT installation. Refer to the documentation of your SORT program
to determine the SORTMAXMEMBELOW value if you use another one.

2. Determine the minimum amount of memory required below the 16 MB line
   by your SORT program: This value is referred as SORTMINMEMBELOW
   hereafter. To do so, either refer to your SORT program documentation or
   run a sample of SORT program sorting no rows or a very little number of
   rows and check the amount of memory this program has used below the
16MB line (see the SYS value given by the IEF371I message).
SORTMINMEMBELOW is about 2070000 bytes for DFSORT VR1R10.

3. Determine the remaining memory below the 16 MB limit when the
INZUTILB module is loaded in memory: this value is referred as
HPUMEMBELOW hereafter. To do so, run a sample DB2 HPU job
requesting a basic unload (the IVP job is suitable) with the QUIESCE YES
option and no SORT request. Check the amount of memory this program
has used below the 16 MB line (see the SUS value given by the IEF374I
message).

Set the LOWMEM and MAXSORT according to the following rules:
• SORTMINMEMBELOW < LOWMEM < SORTMAXMEMBELOW
• 1 < MAXSORT < (16 MB - HPUMEMBELOW) / LOWMEM

To prevent failures, do not set LOWMEM lower than SORTMINMEMBELOW.

To maximize the amount of memory that is used, set LOWMEM to a value less
than or equal to the value of SORTMAXMEMBELOW. Setting LOWMEM to a
higher value would lead to a waste of memory equal to LOWMEM -
SORTMAXMEMBELOW. Setting LOWMEM equal to LOWMAXMEMBELOW
ensures that any SORT task launched by DB2 HPU can use an amount of
memory up to that value of SORTMAXMEMBELOW. However, as
SORTMAXMEMBELOW might not always be needed, consider setting
LOWMEM to a lower value so that DB2 HPU will attempt to launch more
SORT tasks. Do not decrease LOWMEM to a too low value as it can lead to
failures because some SORT tasks might run out of memory. The default
setting (in parmlib) might not be relevant for some complex unload jobs where
alot of tasks are involved and parallelism is enabled. In such a case, it is
recommended to adjust the value of LOWMEM and MAXSORT via the
Technical Parameters option block in the GLOBAL block in SYSIN.

To improve performance, increase MAXSORT and decrease LOWMEM.

To minimize the consumption of memory below the 16 MB line, decrease
MAXSORT and increase LOWMEM.

Valid values are 1 - 2147483647.

The default value is 270000.

The corresponding SYSIN keyword is LOWMEM in the Technical Parameters
options block, which can be coded in the GLOBAL OPTIONS block.
In previous releases of DB2 HPU, the name of this parameter was
VUX004/LOWMEM.

Wait unit in seconds/100 (VUX007/WAITUNIT)
This parameter is required. It specifies the wait time (in hundredths of
seconds) between two unsuccessful tests of the STOP command.

Valid values are 1 - 2147483647.

The default value is 100 (1 second).

In previous releases of DB2 HPU, the name of this parameter was
VUX007/WAITUNIT.

Number of wait periods before issuing a WTOR (VUX008/WAITQTY)
This parameter is required. It specifies the number of times an unsuccessful
STOP command will be tested before a WTOR is sent to the console. If the
operator answers CANCEL (C), DB2 HPU will stop with return code 8. If the
operator answers WAIT (W), the wait process starts again.
Valid values are 1 - 2147483647.
The default value is 20.
In previous releases of DB2 HPU, the name of this parameter was VUX008/WAITQTY.

**Wait time for the WTOR reply (VUX009/WAITQTYM)**
This parameter is required. It specifies the maximum wait time (in seconds) before an answer is sent to the WTOR message. Utility execution will stop beyond this limit (return code 8).
Valid values are 1 - 2147483647.
The default value is 60.
In previous releases of DB2 HPU, the name of this parameter was VUX009/WAITQTYM.

**Size of work areas (VUX022/VBUFSIZE)**
This parameter is optional. It sets the size, in bytes, of the buffers that are used for communication between DB2 HPU tasks such as reading LDS, formatting data, and sorting data. The value that you set depends on the speed of the system. A higher value has little impact on performance, but a lower value forces DB2 HPU to change tasks more frequently, which increases WAIT TIME and CPU TIME.
Valid values are 1 - 2147483647.
The recommended value is 1000000. Do not change VBUFSIZE unless performance problems occur.
The default value is 1000000.
The corresponding SYSIN keyword is VBUFSIZE in the Technical Parameters options block, which can be coded in the GLOBAL OPTIONS block.
In previous releases of DB2 HPU, the name of this parameter was VUX022/VBUFSIZE.

**Maximum degree of parallelism for LDS reading (VUX025/PARALLEL)**
This parameter is optional. It specifies the parallelism degree for an unload job when you are unloading a partitioned table space. This parameter indicates the maximum number of partitions that are processed in parallel. However, if the unload job includes a sort process, the VUX025 parameter is limited to the use of the VUX005/MAXSORT parameter. When a sort process is included, if the value of the VUX005/MAXSORT parameter is lower than the value that is specified in the VUX025/PARALLEL parameter, the VUX005/MAXSORT parameter is used. You can specify a value of 1 or greater.
Valid values are 1 - 65535.
The default value is 20.
In previous releases of DB2 HPU, the name of this parameter was VUX025/PARALLEL.

**Maximum degree of parallelism between unload tasks (VUX030/UTLPARAL)**
This parameter is optional. It specifies the parallelism degree when you are starting several unload tasks for the same UNLOAD command. An unload task can be when you unload a table space (each table space that is accessed counts for one task, whether it is partitioned or not), or a SELECT statement
that is processed by DB2. If more than one SELECT statement is processed by using DB2, DB2 HPU will count one task for all of these SELECT statements. You can specify a value of 1 or greater.

Valid values are 1 - 65535.

The default value is 5.

In previous releases of DB2 HPU, the name of this parameter was VUX030/UTLPARAL.

**Number of rows retrieved by an SQL FETCH function (VUU035/ULROWSET)**

This parameter is optional. It specifies the number of rows that will be retrieved by a single SQL FETCH. Specifying the number of rows that will be retrieved improves the performance for SELECT statements that are processed by DB2 (using DB2 FORCE or DB2 YES with unsupported SELECT statements). When you specify 1, the multi-fetch function is not used. A standard single-row FETCH is used instead. This function is available only in DB2 Version 8 and later releases.

Valid values are 1 - 32767.

The default value is 100.

In previous releases of DB2 HPU, the name of this parameter was VUU035/ULROWSET.

**Enforce partition parallelism for unloading a table into a single file (VUU036/GBLPARAL)**

This parameter is optional. It specifies whether partition parallelism will be enforced when a table space is unloaded into a single output file.

Specify one of the following values:

**YES**

Parallelism is enforced when table spaces are unloaded. The parallelism degree is set in variables VUX025/PARALLEL and VUX005/MAXSORT when a sort is requested.

**NO**

Parallelism is determined by the number of output files that are coded in the JCL and the explicit selection of partitions in the SYSIN. You can override this PARMLIB variable by using the PARALLELISM SYSIN keyword (DB2 HPU syntax only).

The default value is NO.

In previous releases of DB2 HPU, the name of this parameter was VUU036/GBLPARAL.

**Support parallelism for unloading several partitions (VUU044/SUBTKSOF)**

This parameter is optional. It specifies whether parallelism is supported when data is unloaded from several partitions into a single output data set.

Specify one of the following values:

**NO**

Does not support parallelism when data is unloaded from several partitions into a single output data set. NO is the recommended value.

**YES**

Supports parallelism when data is unloaded from several partitions into a single output data set.

The default value is NO.
Attention: Do not change this value unless IBM asks you to change it.

In previous releases of DB2 HPU, the name of this parameter was VUU044/SUBTKSOF.

Maximum number of partitions processed in one unload (VUU060/ULMAXPAR)

This parameter is optional. It specifies the maximum number of partitions that DB2 HPU can process in a single unload operation. ULMAXPAR affects logical unload operations (SELECT) that are processed natively and physical unload operations only. You can use this parameter to reduce the memory consumption of DB2 HPU.

If the total number of partitions that have to be processed for a table space is larger than the value that is specified in ULMAXPAR, DB2 HPU automatically splits the single unload operation into several unload operations to respect the value of ULMAXPAR. If the value of ULMAXPAR is smaller than the value of PARALLELISM at the partition level, the effective partition parallelism is limited by ULMAXPAR.

Valid values are 0 - 4096.

The default value is 0, which means that splitting is not done. When you specify a non-zero value, ORDER BY and ORDER CLUSTER clauses can be used only when each partition is unloaded into a separate file. When you specify a non-zero value and a split is done, the OUTMAXROWS or UNLMAXROWS setting applies to each partition.

The corresponding SYSIN keyword is MAXPART, which can be specified in the GLOBAL OPTIONS block or the UNLOAD block.

In previous releases of DB2 HPU, the name of this parameter was VUU060/ULMAXPAR.

Size of the buffer used to retrieve LOB data (VUU041/ULOCSIZE)

This parameter is optional. It specifies the size of the buffer, in bytes, to be used to retrieve LOB data by using a LOB locator through DB2. This parameter is used in DB2 Versions 7 and 8 when retrieving LOB data by using LOBFILE REFERENCE (CLOBF, BLOBF, or DBCLOBF) in DB2 FORCE or DB2 YES with an unsupported SELECT statement. In DB2 Version 9, DB2 HPU uses LOB FILE REFERENCE variables and does not require intermediate buffers.

Valid values are 1 - 16000000.

The default value is 1000000.

In previous releases of DB2 HPU, the name of this parameter was VUU041/ULOCSIZE.

Wait/retry function when resources are unavailable (VUU047/RETRYMOD)

This parameter is optional. If a resource is not available, it specifies whether DB2 HPU uses wait/retry logic. This parameter controls the following availability criteria:

- The status of the DB2 object (table space, partition, or index) that prevents processing
- If LOCK YES is specified in the SYSIN and a LOCK cannot be taken on the corresponding object
- If the dynamic allocation of the LDS files of the table space or index to be unloaded fails

Specify one of the following values:
NONE
DB2 HPU does not use wait/retry logic.

ALL
DB2 HPU uses wait/retry logic for the three kinds of situations in the previous list.

STATUS
DB2 HPU uses wait/retry logic when the status of the DB2 object, table space, partition, or index prevents processing. The following statuses prevent processing:
• CHKP
• GRECP
• UTUT
• PSRBD
• WEPR
• RBDP
• RBDP*
• REORP
• DBETE
• RESTP
• PSRCP
• LPL
• RELDP
• REFP
• RECP
• RECP*

LOCK
DB2 HPU uses wait/retry logic when a LOCK is requested by the LOCK YES option and the LOCK cannot be taken.

LDS
DB2 HPU uses wait/retry logic when LDS allocation fails.

You can specify multiple values except when you specify ALL or NONE. If you specify multiple values, separate them by using commas without spaces. Specify the wait time (in hundredths of a second) between two unsuccessful tests of the resource availability with PARMLIB parameter VUU048/RETRYW, and specify the number of retries with PARMLIB parameter VUU049/RETRYNB.

The default value is NONE.
In previous releases of DB2 HPU, the name of this parameter was VUU047/RETRYMOD.

Wait time between tries to access unavailable resources (VUU048/RETRYW)
This parameter is optional. It specifies the wait time (in hundredths of seconds) between two unsuccessful tests of the resource availability that is defined by the VUU047/RETRYMOD parameter.
Valid values are 1 - 32767.
The default value is 100 (1 second).
In previous releases of DB2 HPU, the name of this parameter was VUU048/RETRYW.

Number of retries when resources are unavailable (VUU049/RETRYNB)

This parameter is optional. It specifies the number of times to test the availability of a resource before stopping with return code 8.

Valid values are 1 - 32767.

The default value is 20.

In previous releases of DB2 HPU, the name of this parameter was VUU049/RETRYNB.

Concurrent access resolution for prepared statement (VUU061/ACCPREP)

This parameter is optional. Use it to specify the CONCURRENT ACCESS RESOLUTION option for the PREPARE statement that DB2 HPU will use to process SELECT statements by using DB2.

Specify one of the following values:

WAIT
- The WAIT FOR OUTCOME clause is specified to wait for the commit or rollback of data that is being updated or deleted.

USE
- The USE CURRENTLY COMMITTED clause is specified to use the currently committed version of the data that is being updated or deleted.
- The USE option is supported only in DB2 10 and later releases.

The VUU061 parameter does not have a default value.

In previous releases of DB2 HPU, the name of this parameter was VUU061/ACCPREP.

DB2 HPU sort parameters

The DB2 HPU sort parameters section on the Product Parameters panel (CCQPPRD) in Tools Customizer contains the sort parameters that are used by DB2 HPU.

The following list describes the common sort parameters. The parameters are listed in the following format:

description (Vxxnnnn/parameter-name)

Maximum number of active sorts processes (VUX005/MAXSORT)

This parameter is optional. It specifies the maximum number of active sorts that can run in the same step when parallel processing is involved. IBM DFSORT for z/OS supports MAXSORT values 1 - 20, and all of its modules are reusable.

Most of the non-IBM sort products contain modules that require MAXSORT=1 because not all of their modules are reusable.

To improve performance, increase MAXSORT and decrease LOWNMEM.

To minimize the consumption of memory below the line, decrease MAXSORT and increase LOWNMEM.

Valid values are 1 - 32767.

The default value is 20.
The corresponding SYSIN keyword is MAXSORT in the Technical Parameters options block, which can be coded in the GLOBAL OPTIONS block.

In previous releases of DB2 HPU, the name of this parameter was VUX005/MAXSORT.

**Allocation distribution for the sort input file (VUX006/WRKSPACE)**

This parameter is optional. It specifies the percentage of space that is allocated for the sort input file. WRKSPACE can be one of the following values:

Specify one of the following values:

- **PARTIAL**
  
  Corresponds to a primary and secondary allocation that is equal to 50 percent of the estimated size of the file to be sorted. Two volumes are allowed for this allocation.

- **FULL**
  
  Corresponds to a primary allocation that is equal to 100 percent of the estimated size of the file to be sorted, and to a secondary allocation of 33 percent.

The default value is PARTIAL.

The corresponding SYSIN keyword is WRKSPACE in the Technical Parameters options block, which can be coded in the GLOBAL OPTIONS block.

In previous releases of DB2 HPU, the name of this parameter was VUX006/WRKSPACE.

**Sort program that DB2 HPU uses to sort data (VUX037/SORTUTIL)**

This parameter is optional. It allows you to specify which sort program to use when DB2 HPU needs to perform a sort operation outside of DB2.

Specify one of the following values:

- **SORT**
  
  The on-site sort program is used. The load module name is DFSORT.

- **DB2SORT**
  
  The IBM DB2 Sort for z/OS utility (DB2 Sort) is used. DB2 Sort can improve the performance of utility sort processing, especially in environments with large volumes of data, large table spaces, large indexes, or batch window constraints. These environments require a more sophisticated sorting approach than the approach that is used by tools that are used for general sorting purposes.

  The load module name is DB2SORT. The relevant entry point load module of DB2 Sort must be installed in the system libraries. Specifying DB2SORT does not affect the DB2 settings. Therefore, if you want the sorts performed by DB2 (for unsupported SELECT statements or when DB2 FORCE is specified), you must change the appropriate DB2 settings.

  **Tip:** Specify DB2SORT when you need to perform several sort operations in parallel.

  For more information about DB2 Sort, see the *DB2 Sort for z/OS User’s Guide*.

The default value is SORT.

The corresponding SYSIN keyword is SORTUTIL in the GLOBAL OPTIONS block.
In previous releases of DB2 HPU, the name of this parameter was VUX037/SORTUTIL.

**Number of records in sort work areas (VUM024/SRTNBVRE)**

This parameter is optional. It specifies the number of records in the sort work areas.

**Important:** Specifying a large number of records might increase the amount of storage that DB2 HPU requires.

Valid values are 0 - 2147483647.

The default value is 800.

In previous releases of DB2 HPU, the name of this parameter was VUM024/SRTVNBRE.

**Minimum size in bytes for sort work areas (VUM025/SRTVSMIN)**

This parameter is optional. It specifies the minimum size, in bytes, of the sort work areas.

**Important:** Specifying a large value might increase the amount of storage or memory that DB2 HPU requires.

Valid values are 0 - 2147483647.

The default values are the values that are set for VUX022.

The corresponding SYSIN keyword is SRTVSMIN in the Technical Parameters options block, which can be coded in the GLOBAL OPTIONS block.

In previous releases of DB2 HPU, the name of this parameter was VUM025/SRTVSMIN.

**Maximum size for sort work areas (VUM026/SRTVSMAX)**

This parameter is optional. It specifies the maximum size, in bytes, of the sort work areas.

**Note:** Specifying a large value might increase the amount of memory that DB2 HPU requires.

Valid values are 0 - 2147483647.

The default value is 2000000.

The corresponding SYSIN keyword is SRTVSMAX in the Technical Parameters options block, which can be coded in the GLOBAL OPTIONS block.

In previous releases of DB2 HPU, the name of this parameter was VUM026/SRTVSMAX.

**Customization templates**

Tools Customizer uses the following templates to generate the customization jobs for DB2 HPU.

The following table lists and describes the templates:

<table>
<thead>
<tr>
<th>Template</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INZTVAR</td>
<td>Generates the INZUTIL member containing the non DB2-dependent settings</td>
</tr>
</tbody>
</table>
Table 8. Template names and descriptions (continued)

<table>
<thead>
<tr>
<th>Template</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INZPARM</td>
<td>Defines the dsname of the DB2 HPU PARMLIB to the load modules</td>
</tr>
<tr>
<td>INZHPUCL</td>
<td>Generates the members required to run the DB2 HPU ISPF interface</td>
</tr>
<tr>
<td>INZLAUNC</td>
<td>Generates the clist to be run to add DB2 HPU to DB2 Tools Launchpad</td>
</tr>
<tr>
<td>INZADTOO</td>
<td>Generates a member with instructions for adding DB2 HPU into DB2 Admin</td>
</tr>
<tr>
<td>INZBIND</td>
<td>Binds the plans and packages that are used by DB2 HPU and grants access</td>
</tr>
<tr>
<td>INZEXECUE</td>
<td>Generates a sample job for running DB2 HPU against a given subsystem</td>
</tr>
<tr>
<td>INZZSCOD</td>
<td>Defines the list of abend codes trapped for dump</td>
</tr>
<tr>
<td>INZCHECK</td>
<td>Generates members with the DB2-dependent settings and runs DB2 HPU IVP</td>
</tr>
<tr>
<td>INZFREE</td>
<td>Frees the DB2 HPU plan for a DB2 subsystem or a data sharing group</td>
</tr>
</tbody>
</table>

**Worksheets: DB2 Sort**

Complete the following worksheets before you customize DB2 Sort.

**Worksheets: Gathering required data set names and parameter values**

During the customization process, you will need to provide parameter values for DB2 Sort, and in some cases, for DB2.

Use the worksheets in this topic to record the appropriate parameter settings for your purposes, and then use these worksheets during the customization process. The worksheets are organized based on the order of the customization panels in Tools Customizer.

**Tip:** Print the following worksheets and refer to them during the customization process.

**Discover customized product information**

If you have already customized a version of DB2 Sort and you want to use the same parameter values to customize a different version, you can use the Discover EXEC in Tools Customizer. The Discover panel will prompt you for the name of the library from the previous version of DB2 Sort.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Your value</th>
</tr>
</thead>
<tbody>
<tr>
<td>(Prior) SCNKLINK</td>
<td>The DB2 Sort SCNKLINK library from the previous version, such as CNK130.SCNKLINK</td>
<td></td>
</tr>
</tbody>
</table>
Parameters: Data set names and installation options

Data set names for Tools Customizer

If you have not previously used Tools Customizer, you will need to provide values for Tools Customizer data sets on the Tools Customizer Settings panel. In this worksheet, record the names of the Tools Customizer data sets.

<table>
<thead>
<tr>
<th>Data set name / hlq</th>
<th>Description</th>
<th>Special requirements</th>
<th>Your data set name / hlq</th>
</tr>
</thead>
<tbody>
<tr>
<td>DB2TOOL.PRODUCT.CUST</td>
<td>Customization library qualifier</td>
<td>You must have write access to this data set qualifier.</td>
<td></td>
</tr>
<tr>
<td>SCCQDENU</td>
<td>Metadata library for Tools Customizer</td>
<td>None.</td>
<td></td>
</tr>
<tr>
<td>DISCOVER</td>
<td>Discover output data set</td>
<td>You must have write access to this data set.</td>
<td></td>
</tr>
<tr>
<td>DATASTOR</td>
<td>Data store data set</td>
<td>You must have write access to this data set.</td>
<td></td>
</tr>
</tbody>
</table>

Data set names for DB2 Sort

In this worksheet, record the names of the data sets for the DB2 Sort version that you are now customizing.

<table>
<thead>
<tr>
<th>Data set name</th>
<th>Description</th>
<th>Special requirements</th>
<th>Your data set name</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCNKLINK</td>
<td>DB2 Sort SCNKLINK library</td>
<td>This data set must be APF-authorized.</td>
<td></td>
</tr>
<tr>
<td>SCNKLPA</td>
<td>DB2 Sort SCNKLPA library</td>
<td>If this data set is not in the LPA, it must be APF-authorized.</td>
<td></td>
</tr>
<tr>
<td>SCNKUSER</td>
<td>DB2 Sort SCNKUSER library</td>
<td>You must have read access to this data set.</td>
<td></td>
</tr>
</tbody>
</table>

DB2 Sort installation options

In this worksheet, record the values for the DB2 Sort installation options.

<table>
<thead>
<tr>
<th>Installation option</th>
<th>Delivered default value</th>
<th>Discovered?</th>
<th>Your value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sort work DASD pool</td>
<td>SYSDA</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>Sort work DASD type</td>
<td>3390</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>Number of allocation retry attempts</td>
<td>5</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>Minutes between retry attempts</td>
<td>3</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>Sort work storage class</td>
<td>None</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>Maximum number of sort works</td>
<td>32</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>TUNEMSG</td>
<td>ON</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>OPTMODE</td>
<td>ELAP</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>PAGEMON</td>
<td>OFF</td>
<td>Yes</td>
<td></td>
</tr>
</tbody>
</table>
### IVP parameters

If you want to run the Installation Verification Program (IVP), you will need to supply values on the DB2 Parameters panels for the items in the following table. This task is optional.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Default value</th>
<th>Your value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>Yes</td>
<td>NFM</td>
<td></td>
</tr>
<tr>
<td>Level number</td>
<td>Yes</td>
<td>blank</td>
<td></td>
</tr>
<tr>
<td>Load library</td>
<td>Yes</td>
<td>DSN.SDSNLOAD</td>
<td></td>
</tr>
<tr>
<td>Run library</td>
<td>Yes</td>
<td>DSN.RUNLIB.LOAD</td>
<td></td>
</tr>
<tr>
<td>SYSAFF for DB2 utilities</td>
<td>No</td>
<td>blank</td>
<td></td>
</tr>
<tr>
<td>Plan name for the DSNTEP2 utility</td>
<td>Yes</td>
<td>DSNTEP2</td>
<td></td>
</tr>
<tr>
<td>Schema name</td>
<td>Yes</td>
<td>SYSTOOLS</td>
<td></td>
</tr>
<tr>
<td>SQL authorization ID</td>
<td>Yes</td>
<td>blank</td>
<td></td>
</tr>
<tr>
<td>Database name for the IVP</td>
<td>Yes</td>
<td>CNKDBNAM</td>
<td></td>
</tr>
<tr>
<td>Storage group name for the IVP</td>
<td>Yes</td>
<td>CNKSTORG</td>
<td></td>
</tr>
<tr>
<td>VCAT name for DB2 storage group for the IVP</td>
<td>Yes</td>
<td>CNKVCAT</td>
<td></td>
</tr>
<tr>
<td>Unique identifier for DB2 utilities for the IVP</td>
<td>Yes</td>
<td>CNKUID</td>
<td></td>
</tr>
</tbody>
</table>
### IVP parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Default value</th>
<th>Your value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Spare 4K buffer pool for IVP table space</td>
<td>Yes</td>
<td>BP48</td>
<td></td>
</tr>
<tr>
<td>Current VPSIZE for 4K BP used by IVP table space</td>
<td>Yes</td>
<td>2000</td>
<td></td>
</tr>
<tr>
<td>Spare 4K buffer pool for IVP index space</td>
<td>Yes</td>
<td>BP49</td>
<td></td>
</tr>
<tr>
<td>Current VPSIZE for 4K BP used by IVP index space</td>
<td>Yes</td>
<td>2000</td>
<td></td>
</tr>
<tr>
<td>Table space name for IVP table 1</td>
<td>Yes</td>
<td>CNKTBSPI</td>
<td></td>
</tr>
<tr>
<td>Table space name for IVP table 2</td>
<td>Yes</td>
<td>CNKTBSPI2</td>
<td></td>
</tr>
<tr>
<td>Table name for IVP table 1</td>
<td>Yes</td>
<td>CNKTBLN1</td>
<td></td>
</tr>
<tr>
<td>Table name for IVP table 2</td>
<td>Yes</td>
<td>CNKTBLN2</td>
<td></td>
</tr>
<tr>
<td>Index name 1 for IVP table 1</td>
<td>Yes</td>
<td>CNKIDX11</td>
<td></td>
</tr>
<tr>
<td>Index name 2 for IVP table 1</td>
<td>Yes</td>
<td>CNKIDX12</td>
<td></td>
</tr>
<tr>
<td>Index name 3 for IVP table 1</td>
<td>Yes</td>
<td>CNKIDX13</td>
<td></td>
</tr>
<tr>
<td>Index name 4 for IVP table 1</td>
<td>Yes</td>
<td>CNKIDX14</td>
<td></td>
</tr>
<tr>
<td>Index name 5 for IVP table 1</td>
<td>Yes</td>
<td>CNKIDX15</td>
<td></td>
</tr>
<tr>
<td>Index name 1 for IVP table 2</td>
<td>Yes</td>
<td>CNKIDX21</td>
<td></td>
</tr>
<tr>
<td>Index name 2 for IVP table 2</td>
<td>Yes</td>
<td>CNKIDX22</td>
<td></td>
</tr>
<tr>
<td>Index name 3 for IVP table 2</td>
<td>Yes</td>
<td>CNKIDX23</td>
<td></td>
</tr>
</tbody>
</table>

### Worksheets: DB2 Utilities Enhancement Tool

Refer to the following information before you customize DB2 Utilities Enhancement Tool.
### Worksheets: Gathering required data set names

Identify and record the data set names that will be used during the customization process and make sure that requirements for certain data sets are met.

#### Data set names for Tools Customizer

Identify and record the following Tools Customizer data set names:

<table>
<thead>
<tr>
<th>Data set name</th>
<th>Special requirements</th>
<th>Your data set name</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCCQDENU</td>
<td>Metadata library for Tools Customizer</td>
<td>None</td>
</tr>
<tr>
<td>SCCQLOAD</td>
<td>Executable load module library for Tools Customizer</td>
<td>None</td>
</tr>
<tr>
<td>SCCQMENU</td>
<td>ISPF messages for Tools Customizer</td>
<td>None</td>
</tr>
<tr>
<td>SCCQPENU</td>
<td>ISPF panels for Tools Customizer</td>
<td>None</td>
</tr>
<tr>
<td>SCCQSAMP</td>
<td>Sample members for Tools Customizer</td>
<td>None</td>
</tr>
<tr>
<td>SCCQTENU</td>
<td>Table library for Tools Customizer</td>
<td>You must have write access to this data set.</td>
</tr>
</tbody>
</table>

#### Data set names for DB2 Utilities Enhancement Tool

Identify and record the following DB2 Utilities Enhancement Tool data set names. During the customization process, you will enter the following values on panel CCQPRD.

<table>
<thead>
<tr>
<th>Data set name and description</th>
<th>Special requirements</th>
<th>Your data set name</th>
</tr>
</thead>
<tbody>
<tr>
<td>SABPDBRM  DBRM library for DB2 Utilities Enhancement Tool</td>
<td>None</td>
<td></td>
</tr>
<tr>
<td>SABPLOAD  Executable load module library for DB2 Utilities Enhancement Tool</td>
<td>You must APF authorize this data set.</td>
<td></td>
</tr>
<tr>
<td>SABPMENU  ISPF messages for DB2 Utilities Enhancement Tool</td>
<td>None</td>
<td></td>
</tr>
<tr>
<td>SABPPENU  ISPF panels for DB2 Utilities Enhancement Tool</td>
<td>None</td>
<td></td>
</tr>
<tr>
<td>Data set name and description</td>
<td>Special requirements</td>
<td>Your data set name</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>----------------------</td>
<td>-------------------</td>
</tr>
<tr>
<td><strong>SABPSAMP</strong> Sample members for DB2 Utilities Enhancement Tool</td>
<td>None</td>
<td></td>
</tr>
<tr>
<td><strong>SABPDENU</strong> Metadata library for DB2 Utilities Enhancement Tool product parameters</td>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

**Data set names of other libraries used by Tools Customizer**

Identify and record the following data set names. During the customization process, you will enter the following values on the Tools Customizer Settings panel (CCQPSET).

<table>
<thead>
<tr>
<th>Data set name and description</th>
<th>Special requirements</th>
<th>Your data set name</th>
</tr>
</thead>
</table>
| **Product customization library** Contains the customization jobs that Tools Customizer generates for DB2 Utilities Enhancement Tool. To customize DB2 Utilities Enhancement Tool, submit the members of the data set in the order in which they are displayed on the Finish Product Customization panel. The data set naming convention is: $hlq.$LPAR-name$.xyzvrm

where:
- $hlq$ is the value of the Customization library qualifier field on the Tools Customizer Settings panel (CCQPSET)
- $LPAR-name$ is the four-character LPAR name
- $xyzvrm$ is the three-letter product identifier with the version, release, and modification level

For example, the data set name might be DB2TOOL.PRODUCT.CUST.$MVS1$.XYZ410. | You must have write access to this data set. |          |
<table>
<thead>
<tr>
<th>Data set name and description</th>
<th>Special requirements</th>
<th>Your data set name</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>BBY load library data set</strong></td>
<td>Specifies the fully qualified library name for the DB2 Utilities Solution Pack load module (BBY$NMIC).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>If the DB2 Utilities Solution Pack (BBY) was not purchased, this value should be left blank.</td>
<td></td>
</tr>
<tr>
<td><strong>Discover output data set</strong></td>
<td>Contains the output that is generated when you run the DB2 Utilities Enhancement Tool Discover EXEC.</td>
<td>You must have write access to this data set.</td>
</tr>
<tr>
<td></td>
<td>The DB2 Utilities Enhancement Tool Discover EXEC retrieves the metadata and values for the parameters from a previous customization of DB2 Utilities Enhancement Tool.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The default name of the data set is DB2TOOL.CCQ110.DISCOVER. You can change the default value on the Tools Customizer Settings panel or the Discover Customized Product Information panel.</td>
<td></td>
</tr>
<tr>
<td><strong>Data store data set</strong></td>
<td>Contains product, LPAR, and DB2 parameter values, and DB2 entry associations. Tools Customizer uses this data set to permanently store all information that is acquired about the product, DB2 subsystems, and LPAR when you customize products on the local LPAR.</td>
<td>You must have write access to this data set.</td>
</tr>
<tr>
<td></td>
<td>The default name of the data set is DB2TOOL.CCQ110.DATASTOR. You can change the default value on the Tools Customizer Settings panel.</td>
<td></td>
</tr>
</tbody>
</table>

**Worksheets: Gathering parameter values for Tools Customizer**

During the customization process, you will need to provide parameter values for DB2 Utilities Enhancement Tool, for DB2, and for your LPAR.
Use the worksheets in this topic to record the appropriate parameter settings for your purposes, and then use these worksheets during the customization process. The worksheets are organized based on the order of the customization panels in the Tools Customizer.

**Metadata library for DB2 Utilities Enhancement Tool**

**Description**

Use the following worksheet to identify and record the value of the metadata library for DB2 Utilities Enhancement Tool. During the customization process, you will enter this value on the Specify the Metadata Library panel (CCQPHLQ).

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Discovered?</th>
<th>Your value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metadata library</td>
<td>No</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The default name of the metadata library after the product has been SMP/E installed is <em>hlq</em>.SABPDENU, where <em>hlq</em> is the high-level qualifier for DB2 Utilities Enhancement Tool.</td>
<td></td>
</tr>
</tbody>
</table>

**Customization values for the Discover EXEC**

**Description**

Use the following worksheet to identify and record the required customization values for the Tools Customizer Discover EXEC. The values in this worksheet are for extracting information from a product that has already been customized. During the customization process, you will enter these values on panel CCQPDSO.

**Note:** Complete this worksheet only if you are recustomizing a product that has previously been customized by using Tools Customizer.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Sample or default value</th>
<th>Your value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discover EXEC for Extracting Information from an Already Customized product</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Discover EXEC library</strong></td>
<td><em>hlq</em>.mlq.SABPDENU</td>
<td></td>
</tr>
<tr>
<td><strong>Discover EXEC name</strong></td>
<td>ABPDISCO</td>
<td></td>
</tr>
<tr>
<td><strong>Discover output data set</strong></td>
<td>The name that you specified in option 0 User Settings from the Tools Customizer main menu.</td>
<td></td>
</tr>
<tr>
<td><strong>Information for Discover EXEC section</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>DB2 UET V2.2 Configuration ID</strong></td>
<td>ABP1</td>
<td></td>
</tr>

</tbody>
</table>

**Product to Customize section**

**Description**

The parameters that are listed in the Product to Customize section are read-only. They contain information that was provided on other panels, by Tools Customizer, or by the DB2 Utilities Enhancement Tool metadata data set.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Discovered?</th>
<th>Source of this value</th>

<tr>
<td><strong>Product metadata library</strong></td>
<td>Yes</td>
<td>This value is specified on the Specify the Product to Customize panel (CCQPHLQ)</td>
</tr>
</tbody>
</table>
### Required parameters section

**Description**

The parameters in this task are required for all customizations. During the customization process, you will enter these values on panel CCQPRD.

**Note:** Tools Customizer displays some parameters only after you have selected tasks or specified values on the Product Parameters panel. Therefore, you must first define a primary SSID on the DB2 Parameters panel, then select values on the Product Parameters panel. Return to the DB2 Parameters panel to review options that were added as a result of your specifications on the Product Parameters panel.

**Task: Create customized DB2 UET jobs**

**Description**
This required task must be selected before you can select any of the subtasks that are described in the following sections. To create JCL that customizes an installation of DB2 UET, you must have first defined product-specific parameters and have associated a DB2 SSID with this customization. The generated job names themselves might vary, however, the template names do not.

**Task: Create DB2 UET objects**

**Description**
This task creates the required DB2 objects for use with DB2 UET for the subsystem on which DB2 UET was customized.
Template name
ABPOBJCR. You must run this template job once for each SSID on which you will use DB2 UET. The generated job is stored in the Product Customization Library that is displayed on the Finish Product Customization panel.

Task: Create additional indexes

Description
This optional (but highly recommended) task creates three additional indexes on DB2 catalog tables to improve the performance of DB2 catalog queries.

Template name
ABPIDXCR. If you decide to use the performance indexes, you must run this template job at least once for each SSID on which you will use DB2 UET. The generated job is stored in the Product Customization Library that is displayed on the Finish Product Customization panel.

Tip: Generate the job to see the columns that are needed for the additional performance indexes, but before running the job, check for a suitable existing index that can be used.
If any of the indexes that the DB2 UET packages depend upon are dropped, then those packages are invalidated, causing a REBIND the next time that the package is invoked.

Task: Create LOG/AUDIT Migration job

Description
This optional task extracts data from your existing LOG and AUDIT tables and loads the data into the new tables. This task is recommended if you want to use fully populated tables on which to base the statistics and plan.

Template name
ABPMIGRT. This template, when submitted, will use different methods to extract data from your existing Log and Audit tables and load the data into the new tables. The generated job is stored in the Product Customization Library that is displayed on the Finish Product Customization panel.

<table>
<thead>
<tr>

<th>Your value</th>
</tr>
</thead>
<tbody>
<tr>
<td>V2.1 LOG and AUDIT tables CREATOR name</td>
<td>Yes</td>
<td>No</td>
<td>ABP21</td>
<td></td>
</tr>
</tbody>
</table>

Task: Create JOURNAL Migration job

Description
This optional task extracts data from your existing JOURNAL tables and loads the data into the new tables. This task is recommended if you want to use fully populated tables on which to base the statistics and plan.

Template name
ABPMIGR2. This template, when submitted, will use different methods to extract data from your existing Journal tables and load the data into the new tables. The generated job is stored in the Product Customization Library that is displayed on the Finish Product Customization panel.
Task: Create RUNSTATS job

Description
This optional task runs the RUNSTATS utility to collect catalog statistics for the optional indexes on DB2 catalog tables. This task is recommended if you chose to create the three optional performance indexes on the DB2 catalog.

Template name
ABPRSTCR. You must run this template job at least once for each SSID on which DB2 UET performance indexes will be used. The generated job is stored in the Product Customization Library that is displayed on the Finish Product Customization panel.

Task: Create BIND job

Description
This task binds the required DB2 UET packages and plans for the subsystem on which DB2 UET was customized.

Template name
ABPBNDCR. You must run this template job once for each SSID on which DB2 UET will be used. The generated job is stored in the Product Customization Library that is displayed on the Finish Product Customization panel.

Task: Create cleanup job for a worklist table

Description
This optional task creates SAMPLIB maintenance job ssid#ERR for the DB2 subsystem designated as the primary DB2 subsystem. ssid is the primary DB2 subsystem on which DB2 UET is being customized.

Job ssid#ERR is created for DB2 subsystems monitored by DB2 UET. The job contains SQL statements for manually deleting rows from the DSNUTILB-intercept worklist error tables that are older than the number of days specified. The job is stored in the hlq.mlq.SABPSAMP data set, where hlq and mlq are the product data set high-level qualifier and mid-level qualifier that were specified on the Product Parameters panel.

Template name
ABPWKLCR. You must run this template job at least once for each primary DB2 subsystem. The generated job is stored in the Product Customization Library that is displayed on the Finish Product Customization panel.

Task: Create the options module

Description
This task creates the options module abpidOPTS for use with the DB2 UET started task. abpid is the value that you specified in the DB2 UET configuration name field on the Product Parameters panel.

Template name
ABPOPTCR. This template is created once per DB2 UET configuration, and
you must run it at least once for each DB2 UET configuration that you customize. The generated job is stored in the Product Customization Library that is displayed on the Finish Product Customization panel.

<table>
<thead>
<tr>
<th>Step or parameter</th>
<th>Discovered?</th>
<th>Default value</th>
<th>Your value</th>

</table>

Whether you want to replace any MAPPINGTABLE specifications that you manually defined in the input data sets for the DB2 REORG TABLESPACE utility with the MAPPINGTABLE specifications that DB2 UET automatically generates for the utility. Valid values are: Y (Yes) and N (No).

Post-cancel user exit specifies the name of the user exit that you optionally created for performing some processing that you determined is necessary after thread cancelations. For example, you might create a post-cancel exit to notify users when thread-cancelation processing completes. If you are not using a post-cancel exit, specify NONE (the default value).

Pre-cancel user exit specifies the name of the user exit that you optionally created for performing some processing that you determined is necessary prior to thread cancelations. For example, you might create a pre-cancel exit to determine the DB2 objects that an application or utility will need to access. If you are not using a pre-cancel exit, specify NONE (the default value).

Security-cancel exit specifies the name of the user exit that you optionally created for verifying user authority to perform thread-management functions such as blocking and canceling threads and to access specific ISPF panels. If you are not using a security exit, specify NONE (the default value).

Shadow database prefix specifies a prefix for the names of shadow objects that are used with the IFDISCARDS and SHRELEVEL REFERENCE options in the LOAD utility. The prefix can be one to four characters, and must follow standard DB2 naming conventions for databases. For each invocation of the Load Prevalidate or LOAD REPLACE SHRELEVEL REFERENCE feature, DB2 UET generates a unique set of shadow object names by using the specified prefix and appending a numeric suffix.

<td></td>
<td></td>
</tr>
<tr>
<td>Step or parameter</td>
<td>Discovered?</td>
<td>Default value</td>
<td>Your value</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------</td>
<td>---------------</td>
<td>------------</td>
</tr>
<tr>
<td><strong>Workfile storage class</strong></td>
<td>Yes</td>
<td>NONE</td>
<td></td>
</tr>
<tr>
<td>The name of a valid SMS storage class for the temporary DASD data sets that are allocated by DB2 UET, or the value NONE.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Workfile unit</strong></td>
<td>Yes</td>
<td>SYSALLDA</td>
<td></td>
</tr>
<tr>
<td>The unit name for the location where the temporary DASD data sets that are allocated by DB2 UET are stored. Specify a valid unit name of a storage device or the value NONE. You can specify VIO if VIO (virtual input/output) is supported on your system and you want the temporary data sets to reside entirely in paging storage to improve performance. Alternatively, you can specify SYSALLDA to use any available DASD device.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Maximum worklist table age</strong></td>
<td>Yes</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>Specifies the maximum number of days to retain rows in the DSNUTILB intercept worklist-error tables. A DSNUTILB intercept worklist contains the enhanced SYSIN information for a DB2 utility and can be used for restart purposes if a utility terminates. Worklist data is moved to worklist-error tables for diagnostic use by Customer Support in certain situations. After rows in the worklist-error tables reach the specified age limit, they are eligible for deletion. The next time a new row is inserted into a worklist-error table, the rows that meet the age limit are deleted. You can specify a value from 0 through 32,767 for this option. The default value is 0, which prevents the deletion of old rows from the worklist-error tables based on this option. If you accept the default value, you might need to manually delete old rows from these tables periodically to prevent the tables from becoming too large. Use the sample SQL that is provided in the SABPSAMP member ssid#ERR, where ssid is the 4-character subsystem on which the tables reside.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>WTO ROUTCDE</strong></td>
<td>Yes</td>
<td>11</td>
<td></td>
</tr>
<tr>
<td>Specifies the routing code for write-to-operator (WTO) messages regarding DB2 UET operations. Routing codes identify the z/OS console to which to send WTO messages and are defined when DB2 is installed. Valid values are from 1 through 28. The default value is 11. The product administrator will be able to temporarily override this value by entering another routing code on the Control System panel.</td>

**Task: Create BCAN, BGLB, PROC, PLCY members**

**Description**
This optional task creates the following SAMPLIB members that are used by the DSNUTILB Intercept to block and cancel threads. In each member name, abpid is the value that you specified in the **DB2 UET configuration name** field on the Product Parameters panel. Each member is created once per DB2 UET configuration that is being customized. Each member is stored in the hlq.mlq.SABPSAMP data set, where hlq and mlq are the...
product data set high-level qualifier and mid-level qualifier that were specified on the Product Parameters panel.

- *abpid*BCAN contains the optional thread-cancel parameters that the DSNUTILB intercept uses for each cancel request for a DB2 utility.
- *abpid*BGLB contains the optional global parameters that pertain to intercept processing activities that the DSNUTILB Intercept performs for the started task configuration.
- *abpid*PROC contains the started task PROC for DB2 UET.
- *abpid*PLCY contains a sample policy for use with the started task for the DB2 UET.

**Template name**

ABPMODCR. This template is created once per DB2 UET configuration, and you must run it at least once for each DB2 UET configuration that you customize. The generated job is stored in the Product Customization Library that is displayed on the Finish Product Customization panel.

**Task: Create maintenance members**

**Description**

This optional task creates the following SAMPLIB members. In each member name, *abpid* is the value that you specified in the DB2 UET configuration name field on the Product Parameters panel. Each member is created once per DB2 UET configuration that is being customized.

- *abpid*COMX, which contains a utility that resets DB2 UET COMX control blocks. Use this utility only when IBM Software Support directs you to do so.
- *abpid*MAIN, which contains the job that runs the DB2 UET batch interface program.
- *abpid*MNT, which contains the job that runs the ABPMAINT utility. This utility maintains the intercept worklist tables on the primary SSID. You can use the utility to
  - terminate a DB2 utility for which DSNUTILB interception has occurred and to remove the worklist data that is associated with the utility ID
  - restart a DB2 utility from the appropriate point after it ended because of exceptional circumstances that prevented a normal DB2 restart

Task Create maintenance members also creates the following SAMPLIB members for DB2 subsystems that are designated as the primary subsystem:

- *ssid#*LOG, which contains SQL statements for manually deleting rows from the log tables that are older than the number of days specified.
- *ssid#*AUD, which contains SQL statements for manually deleting rows from the audit table that are older than the number of days specified.

All members are stored in the hlq.mlq.SABPSAMP data set, where hlq and mlq are the product data set high-level qualifier and mid-level qualifier that were specified on the Product Parameters panel.

**Template name**

ABPSMPCR. This template is created once per DB2 UET configuration, and must be run at least once for each DB2 UET configuration that is being customized. The generated job is stored in the Product Customization Library that is displayed on the Finish Product Customization panel.
Task: Create product CLISTs

Description
This optional task creates CLIST members ABPRUN and ABPF.

Template name
ABPRUNCR. This template is created once per DB2 UET configuration and is required to be run at least once. This generated job is stored in the Product Customization Library that is displayed on the Finish Product Customization panel.

DB2 Parameters section

Description
This section contains DB2 parameters. All parameters are required. During the customization process, you will enter these values on panel CCQPDB2.

You can create a DB2 entry as the primary subsystem or secondary subsystem and associate it with DB2 UET. When customizing DB2 UET, you must first define a primary subsystem before you can define product parameters.

You can customize DB2 UET only on DB2 entries that are associated with DB2 UET. The list of DB2 entries is on the Customizer Workplace panel. You can customize any associated DB2 entries for DB2 UET.

Note: Tools Customizer displays some parameters only after you have selected tasks or specified values on the Product Parameters panel. Therefore, you must first define a primary SSID on the DB2 Parameters panel, then select values on the Product Parameters panel. Return to the DB2 Parameters panel to review options that were added as a result of your specifications on the Product Parameters panel.

Worksheets: Gathering parameter values for Tools Customizer

During the customization process, you will need to provide parameter values for the product that you are customizing, for DB2, and for your LPAR.

Use the worksheets in this topic to record the appropriate parameter settings for your purposes, and then use these worksheets during the customization process. The worksheets are organized based on the order of the customization panels in Tools Customizer.

**Settings for Tools Customizer**

**Description**

Use the following worksheet to identify and record the values for Tools Customizer settings. During the customization process, you will enter these values on the Tools Customizer Settings panel (CCQPSET).

For more information about the parameters in this section, see “Data sets that Tools Customizer uses during customization” on page 278.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Sample or default value</th>
<th>Your value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Customization library qualifier</td>
<td>DB2TOOL.PRODUCT.CUST</td>
<td></td>
</tr>
<tr>
<td>Use DB2 group attach</td>
<td>YES</td>
<td></td>
</tr>
</tbody>
</table>

**Tools Customizer Library Settings**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Sample or default value</th>
<th>Your value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metadata library</td>
<td>DB2TOOL.CCQ110.SCCQDENU</td>
<td></td>

</table>
Chapter 3. Pre-customization tasks

Some components of the DB2 Utilities Solution Pack have pre-customization tasks that must be completed before you can customize the component. These tasks are identical to the ones that apply to the stand-alone version of a component (that is, as a separately orderable product).

Pre-customization tasks: DB2 High Performance Unload

Before you customize DB2 High Performance Unload, ensure that your environment meets the hardware and software requirements for this component.

Authorizing and enabling DB2 HPU

Before you can use DB2 HPU for the first time, you must APF authorize the SINZLINK library and enable the DB2 HPU batch utility.

About this task

Enabling the DB2 HPU batch utility lets you unload DB2 data. You must create a batch utility job before you can run the DB2 HPU batch utility.

Procedure

1. Specify the SETPROG command in the following format:
   SETPROG APF,ADD,DSNAME=SINZLINK-data-set-name,VOLUME=volume-name

   The following example shows the SETPROG command in the correct format:
   SETPROG APF,ADD,DSNAME=DMT.PTF420.SINZLINK,VOLUME=V01001

   You can include this command in a MVS procedure, in a job, or in both.

2. Use one of the following methods to enable the DB2 HPU batch utility.
   • Put the SINZLINK library in LINKLIST.
   • Specify the SINZLINK library in the STEPLIB statement of all jobs. (Be careful not to lose the APF authorizations with the concatenations.)

Optional: Creating a TSO command for the DB2 HPU interactive component

You can make the DB2 HPU interactive component available as a TSO command.

About this task

With the DB2 HPU interactive component, you can generate the batch utility job to be used to invoke the DB2 HPU batch utility program.

You can run the batch utility program and the DB2 HPU interactive component simultaneously.

Procedure

Use one of the following methods to create a TSO command:
   • Concatenate the SINZCLST library to the SYSPROC concatenation.
Copy the INZHPU procedure into a library in the SYSPROC concatenation.

**What to do next**

Invoke the DB2 HPU interactive component by issuing the following command:

TSO INZHPU.

---

**Pre-customization tasks: DB2 Sort**

You must activate DB2 Sort after it is installed on your system. After activating DB2 Sort, you can use Tools Customizer to change the default installation options.

**Note:** For the best resource utilization, set the **UTSORTAL** parameter to **YES**. This parameter enables you to use real-time statistics to provide the most accurate values for resource allocation.

For information about setting either the **UTSORTAL** or **SORTNUM** parameter, see one of the following documents:

- [DB2 10 for z/OS Installation and Migration Guide (GC19-2974)](#)
- [DB2 Version 9.1 for z/OS Installation Guide (GC18-9846)](#)

---

**Activating DB2 Sort**

Before customizing or using DB2 Sort, you must activate it or verify that it has been activated.

**About this task**

You may have to activate DB2 Sort for use in DB2 for z/OS if it has been migrated from a release earlier than DB2 10 for z/OS.

**Important:** If you are using a newly installed DB2 10 for z/OS or DB2 11 for z/OS, DB2 Sort is automatically activated, so no action is required.

To activate DB2 Sort, use the following procedure.

**Procedure**

1. Apply the following program fix APAR PI19784: **DB2 SORT FOR Z/OS PRECONDITIONING**.
2. Set the DB2 subsystem parameter **DB2SORT** to **ENABLE**.
   
   For information about setting the **DB2SORT** parameter, see one of the following documents:
   
   - [DB2 11 for z/OS Installation and Migration Guide (GC19-4056)](#)
   - [DB2 10 for z/OS Installation and Migration Guide (GC19-2974)](#)

**What to do next**

1. Stop and restart the DB2 subsystem.
2. Customize, test or begin using DB2 Sort.
Chapter 4. Starting and preparing Tools Customizer for use

Use the provided REXX EXEC to start Tools Customizer. The first time that you use Tools Customizer, you must modify the settings that Tools Customizer uses to customize your components.

Best Practice: SMP/E and runtime libraries maintenance strategy for Tools Customizer

Tools Customizer creates relationships between the values for the Product Parameters, LPAR Parameters, and DB2 Subsystem Parameters for each Tools Customizer enabled product. Determining the correct maintenance strategy for your Tools Customizer runtime libraries, after SMP/E processing, can reduce problems working with Tools Customizer and the enabled products through their life cycles.

Tools Customizer has very specific requirements for data set names:
- Only one DATASTOR data set exists per LPAR
- The product metadata library data set names do not change during the life of that release of the Tools Customizer enabled product.

The DATASTOR data set is the repository for all the information that Tools Customizer requires to generate customization JCL for enabled products.

When you update and save the Tools Customizer Settings panel (CCQPSET), as described in “Modifying Tools Customizer user settings” on page 168, the name of the DATASTOR data set is saved in the ISPF profile. This allows Tools Customizer to know the active DATASTOR data set when the TSO user id logs in and starts the Tools Customizer EXEC.

Maintenance scenarios

IBM expects maintenance to be applied to libraries which are then used by Tools Customizer. In practice, different customer shops distribute SMP/E APPLY maintenance in different ways.

The following scenarios explains some considerations and alternatives for determining your maintenance strategy. The one overriding objective is to preserve and maintain the same data set names for the Tools Customizer instance.

Apply SMP/E maintenance to the same data sets (using the SMP/E APPLY command):

If you apply SMP/E maintenance (using the SMP/E APPLY command) using the same data set names with each maintenance cycle, you can either use these target libraries as your Tools Customizer runtime libraries or you can copy the SMP/E target data sets to the runtime libraries that are used by Tools Customizer to customize enabled products.

Tools Customizer assumes that if the product metadata library (*DENU) has the same name, this metadata library is for the same release of the enabled product. For example, assume that you customize DB2 Log Analysis Tool v3.3 and name the metadata library SYS2.DB2T00L.SALADENU, with no indication of the version or release. You then upgrade to DB2 Log
Analysis Tool v3.4 and employ the same naming convention, SYS2.DB2TOOL.SALADENU. Tools Customizer will assume that you are continuing to work with DB2 Log Analysis Tool v3.3 and will report v3.3 on panels and continue to use the same v3.3 Customization Library data set.

A more sustainable approach to naming the data sets is to include a product version, release identifier, or other distinguishing qualifier in the name of the metadata library, so that Tools Customizer can determine the new product release when you upgrade. For example, using metadata library names that include a product version, release identifier, or other distinguishing qualifier, similar to the following, can make product maintenance and upgrades easier:

- DB2TOOL.R330.SALADENU for DB2 Log Analysis Tool v3.3
- DB2TOOL.R340.SALADENU for DB2 Log Analysis Tool v3.4

**Apply SMP/E maintenance to new data sets (using the SMP/E APPLY command):**

If you apply SMP/E maintenance (using the SMP/E APPLY command) to new data sets rather than to the same data sets, the next time you open the product metadata library, Tools Customizer will return a data set error that indicates that the library name is being used by another product or component.

For example, assume that you name the DB2 High Performance Unload for z/OS target metadata libraries to reflect the date of an upgrade or to reflect a specific RSU, as follows:

- To reflect a specific upgrade date (August 2014):
  - DB2TOOL.PTF420.SINZDBRM.D201408
  - DB2TOOL.PTF420.SINZDENU.D201408
  - DB2TOOL.PTF420.SINZLOAD.D201408
- To reflect a specific RSU (RSU 1406):
  - DB2TOOL.PTF420.SINZDBRM.RSU1406
  - DB2TOOL.PTF420.SINZDENU.RSU1406
  - DB2TOOL.PTF420.SINZLOAD.RSU1406

Using either of these naming conventions, the next time you start the Tools Customizer EXEC, it will return a data set error.

To handle this type of SMP/E maintenance processing, you can do either of the following:

- Define aliases (using ALIAS control statements) to reference the appropriate libraries for Tools Customizer processing.
- Copy the SMP/E libraries to a set of runtime libraries that are specifically for Tools Customizer processing.

**Define aliases (using ALIAS control statements) to reference the appropriate libraries for Tools Customizer processing:**

Defining aliases (using ALIAS control statements) for the SMP/E created new product data set names is likely the best strategy when planning for Tools Customizer.

If you are setting up Tools Customizer for the first time, consider specifying the product library data set names with an indicator that these data sets will be used for Tools Customizer processing. For example, use data set names similar to the following names:
After applying maintenance using SMP/E, which creates new product library data sets, you should define aliases (using ALIAS control statements) for the new data set names to the data set names that Tools Customizer originally processed. For example, the following maintenance data sets have aliases defined to the original data sets:

- `DB2TOOL.PTF420.SINZDBRM.RSU1406` --> TCZ.PTF420.SINZDBRM
- `DB2TOOL.PTF420.SINZDENU.RSU1406` --> TCZ.PTF420.SINZDENU
- `DB2TOOL.PTF420.SINZLOAD.RSU1406` --> TCZ.PTF420.SINZLOAD

You will need to define an alias (using ALIAS control statements) to each of the following IBM-distributed Tools Customizer data sets:

- SCCQDENU
- SCCQEXEC
- SCCQLOAD
- SCCQMENU
- SCCQPENU
- SCCQSAMP
- SCCQTENU

If you have already set up Tools Customizer and customized the product, you will have to define aliases (using ALIAS control statements) for the newly created data set names to the data sets that were specified when the product was originally customized using Tools Customizer.

After defining the aliases, you should be able to run Tools Customizer successfully.

**Note:** Only define aliases for IBM-distributed SMP/E libraries.

**Restriction:** Do not define an alias for any Tools Customizer created data sets, like the following three data sets on the Tools Customizer Settings panel (CCQPSET):

- Customization library qualifier
- Discover output data set
- Data store data set

Do not define an alias for any data sets that you create on behalf of a product, for example the DB2 High Performance Unload for z/OS parameter library (INFPLIB).

**Copy the SMP/E libraries to a set of runtime libraries that are specifically for Tools Customizer processing:**

If you are setting up Tools Customizer for the first time, consider specifying the product library data set names with an indicator that these data sets will be used for Tools Customizer processing. For example, use data set names similar to the following names:

- TCZ.R420.SINZDBRM
- TCZ.R420.SINZDENU
After applying maintenance using SMP/E, which creates new product library data sets, you should copy the new data sets to the data sets that Tools Customizer originally processed. For example, copy the following maintenance data sets to the original data sets:

- `DB2TOOL.PTF420.SINZDBRM.RSU1406 --> TCZ.R420.SINZDBRM`
- `DB2TOOL.PTF420.SINZDENU.RSU1406 --> TCZ.R420.SINZDENU`
- `DB2TOOL.PTF420.SINZLOAD.RSU1406 --> TCZ.R420.SINZLOAD`

You will need to copy each of the following IBM-distributed Tools Customizer data sets:

- `SCCQDENU`
- `SCCQEXEC`
- `SCCQLOAD`
- `SCCQMENU`
- `SCCQPENU`
- `SCCQSAMP`
- `SCCQTENU`

If you have already set up Tools Customizer and customized the product, you will have to copy the newly created data sets to the data sets that were specified when the product was originally customized using Tools Customizer.

After copying the SMP/E data sets to the Tools Customizer instance libraries, you should be able to run Tools Customizer successfully.

**Note:** Only copy IBM-distributed SMP/E libraries.

**Restriction:** Do not copy any Tools Customizer created data sets, like the following three data sets on the Tools Customizer Settings panel (CCQPSET):

- Customization library qualifier
- Discover output data set
- Data store data set

Do not copy any data sets that you create on behalf of a product, for example the DB2 High Performance Unload for z/OS parameter library (INFPLIB).

**Related tasks:**
- [Modifying Tools Customizer user settings](#)

Before you can customize a product or a component with Tools Customizer, you must review the settings that Tools Customizer uses.

**Related information:**
- [The SMP/E APPLY command](#)

The APPLY command specifies which of the received SYSMODs are to be selected for installation in the target libraries.

**Alias processing: SMP/E for z/OS Commands**

When an element with aliases is processed, both the element and its aliases are updated. SMP/E does not check the aliases against elements maintained in the target zone.
Starting Tools Customizer

Start Tools Customizer by running a REXX EXEC from the ISPF Command Shell panel.

Before you begin

Tools Customizer must be SMP/E installed. You must know the high-level qualifier of where the Tools Customizer libraries reside. The high-level qualifier is considered to be all the segments of the data set name except the lowest-level qualifier, which is SCCQEXEC.

Attention: Ensure that Tools Customizer load libraries are not APF authorized. APF authorizing Tools Customizer libraries results in an abend.

About this task

To run the REXX EXEC, you must either change the placeholder in the EXEC for the high-level qualifier of the Tools Customizer EXEC library or pass the high-level qualifier as a parameter when you run the EXEC. The REXX EXEC is in the CCQTCZ member of the EXEC library.

Procedure

1. Optional: Change the placeholder for the high-level qualifier in the REXX EXEC:
   a. Find the EXEC library data set for Tools Customizer. The name of the data set is `high_level_qualifier.SCQEXEC`.
   b. Edit data set member CCQTCZ and replace the `<TCZ HLQ>` string with the high-level qualifier of the EXEC library data set. For example, if the name of the Tools Customizer EXEC library is `CCQTCZ.USABSAND.SCQEXEC`, replace `<TCZ HLQ>` with `CCQTCZ.USABSAND`.

   You have to change the placeholder for the high-level qualifier only once. When you run the REXX EXEC, you do not have to pass the high-level qualifier as a parameter.

2. Run the REXX EXEC (CCQTCZ):
   a. From the ISPF Primary Option Menu, select option 6. The ISPF Command Shell panel is displayed.
   b. Specify the EX command to run the REXX EXEC. For example, if the Tools Customizer EXEC library is `CCQTCZ.USABSAND.SCQEXEC` and you changed the placeholder for the high-level qualifier in the REXX EXEC, specify: `EX 'CCQTCZ.USABSAND.SCQEXEC(CCQTCZ)'`

   If you did not change the placeholder for the high-level qualifier in the REXX EXEC, specify: `EX 'CCQTCZ.USABSAND.SCQEXEC(CCQTCZ)'`
   `CCQTCZ.USABSAND`

Results

The IBM Customizer Tools for z/OS main menu panel is displayed.

What to do next

If you are running Tools Customizer for the first time, you must modify the Tools Customizer user settings. If you have already set the Tools Customizer user settings, either customize or recustomize DB2 Utilities Solution Pack.
Modifying Tools Customizer user settings

Before you can customize components in the DB2 Utilities Solution Pack with Tools Customizer, you must review the settings that Tools Customizer uses. You might have to change the default values to suit your environment. In most cases, you can change the Tools Customizer values at any time. For example, after you have customized components in the DB2 Utilities Solution Pack and are customizing a different product or solution pack, you might have to change the settings.

Procedure

1. On the IBM Tools Customizer for z/OS main panel (CCQPHME), specify option 0, User settings for Tools Customizer. The Tools Customizer Settings panel (CCQPSET) is displayed, as shown in the following figure:

   ![Tools Customizer Settings panel (CCQPSET)](image)

2. Review the values for the following required fields. Use the default value or specify your own value. You must have appropriate read and write access to the data sets that are specified.

   **Customization library qualifier**
   
The high-level qualifier that is used as the prefix for the customization library. The customization library is a data set in which the generated jobs to customize components in the DB2 Utilities Solution Pack are stored. Write access to this qualifier is required.

   For each component to be customized, the first value that is specified for the qualifier is always used, even if you change it after you have generated the customization jobs. For example, if you customize a component and then specify a new qualifier for recustomization, although the new qualifier is saved and displayed, the original value is used.

   To maintain multiple instances of Tools Customizer, specify a unique customization library qualifier for each instance of Tools Customizer. Data set names that exceed 42 characters must be enclosed in single quotation marks (').

   **Use DB2 group attach**
   
   Determines the value that is used in the CONNECT statements in the
generated customization jobs. Specify YES for data sharing environments, which causes the group attach name to be used. Specifying NO, in most cases, causes the SSID to be used in the DB2 CONNECT statement.

**Important:** This field has no effect when you are customizing a product on a DB2 subsystem that is not a member of a data sharing group. In this case, the DB2 subsystem ID (SSID) is always used in the CONNECT statements in the generated customization jobs.

When you are customizing a component on a DB2 subsystem that is a member of a data sharing group, how the DB2 subsystem is defined and the value of the **Use DB2 group attach** field determines the value that is used in the CONNECT statements in the generated jobs. The following table shows whether the SSID or the group attach name is used:

<table>
<thead>
<tr>
<th>DB2 subsystem definition</th>
<th>Value of the Use DB2 group attach field</th>
<th>Value that is used in the CONNECT statements</th>
</tr>
</thead>
<tbody>
<tr>
<td>The DB2 subsystem is defined with an SSID.</td>
<td>Yes</td>
<td>Group attach name</td>
</tr>
<tr>
<td></td>
<td>No</td>
<td>SSID</td>
</tr>
<tr>
<td>The DB2 subsystem is not defined with an SSID.</td>
<td>Yes or No</td>
<td>Group attach name</td>
</tr>
</tbody>
</table>

**Note 1:** If you generate jobs for multiple DB2 subsystems that are defined with an SSID and belong to the same data sharing group, the SSID of the first DB2 subsystem that is selected is used.

For example, assume that on the Customizer Workplace panel, you generated jobs for the following DB2 subsystems:

- V91C, which is a stand-alone DB2 subsystem
- V91A, which is a DB2 subsystem that is a member of data sharing group DSG1
- A DB2 subsystem that was not defined with an SSID that is a member of data sharing group DSGA

The following figure shows how these DB2 entries might be listed on the Customizer Workplace panel:

```
Associated DB2 Entries and Parameter Status
Line commands: G - Generate jobs  E - Edit  B - Browse  C - Copy  R - Remove
Cmd  SSID  GrpAttach  Lvl  Mode  User ID  Date   Status  Message
V91C   --    --     910  NFM  SYSADM  2010/11/09  Ready to Customize
V91A   DSG1  910  NFM  SYSADM  2010/11/09  Ready to Customize
--     DSGA  910  NFM  SYSADM  2010/11/09  Ready to Customize
End of DB2 entries -----------------------------
```

The following table shows which values are used in the CONNECT statements in the generated jobs, based on the value of the **Use DB2 group attach** field.
Table 10. Value that is used in the CONNECT statements in the generated jobs

<table>
<thead>
<tr>
<th>SSID</th>
<th>GrpAttach</th>
<th>Value of the Use DB2 group attach field</th>
<th>Value that is used in the CONNECT statements</th>
</tr>
</thead>
<tbody>
<tr>
<td>V91C</td>
<td>--</td>
<td>Yes</td>
<td>SSID</td>
</tr>
<tr>
<td></td>
<td></td>
<td>No</td>
<td>SSID</td>
</tr>
<tr>
<td>V91A</td>
<td>DSG1</td>
<td>Yes</td>
<td>Group attach name</td>
</tr>
<tr>
<td></td>
<td></td>
<td>No</td>
<td>SSID</td>
</tr>
<tr>
<td>--</td>
<td>DSGA</td>
<td>Yes</td>
<td>Group attach name</td>
</tr>
<tr>
<td></td>
<td></td>
<td>No</td>
<td>Group attach name</td>
</tr>
</tbody>
</table>

do not support DB2 group attach names. You must specify NO in the Use DB2 group attach field.

Tools Customizer metadata library
The name of the data set that contains the metadata that is used to display the DB2 and LPAR parameters. The parameters that are displayed on the LPAR Parameters panel and the DB2 Parameters panel depend on the parameters that you define and the tasks and steps that you select on the Component Parameters panel for the component that you are customizing. For example, the DB2 parameters that are required, based on the selected tasks and steps, are displayed on the DB2 Parameters panel, and you can edit them. If they are not required, they are not displayed. Read access to this data set is required. Data set names that exceed 42 characters must be enclosed in single quotation marks (').

Discover output data set
The name of the data set in which the output from the component Discover EXEC is stored. Each component has its own Discover EXEC. The Discover EXEC retrieves the component, LPAR, and DB2 parameters from a previously customized component. Write access to this data set is required. Data set names that exceed 42 characters must be enclosed in single quotation marks (').

Data store data set
The name of the data set where Tools Customizer stores information about component, LPAR, and DB2 parameter values. Information about which components are associated with which DB2 entries (DB2 subsystems, DB2 group attach names, and DB2 data sharing members) is also stored in this data set. Data set names that exceed 42 characters must be enclosed in single quotation marks ('). The specified data store data set can be used with only one invocation of Tools Customizer at a time. Data set names that exceed 42 characters must be enclosed in single quotation marks (').

User job card settings for customization jobs
The job card information to be inserted into the generated jobs for customizing a component. The default value is the job statement information from the ISPF Batch Selection panel.

The first line of the job card automatically begins with the following information:
```plaintext
// JOB
```
where characters 3 - 10 are reserved by Tools Customizer for the job name and includes a blank space after JOB. This name cannot be
edited. Information that you specify on the first line of the job card cannot exceed 57 characters. This character limit includes a continuation character. All other lines of the job card cannot exceed 72 characters.

3. Press End to save and exit. If the Discover output data set and the data store data set that you specified do not exist, Tools Customizer creates them.

Important: If the ISPF sessions unexpectedly ends before you exit Tools Customizer, the fields on the Tools Customizer Settings panel (CCQPSET) will be repopulated with default values, and you will be required to review them or specify new values again.

Results

The values are saved, and the IBM Tools Customizer for z/OS main menu panel (CCQPHME) is displayed again.

What to do next

You are ready to customize or recustomize components in the DB2 Utilities Solution Pack or to change parameter settings.

Related concepts:

Chapter 5, “Customizing components in the DB2 Utilities Solution Pack,” on page 173

Using Tools Customizer to customize components in the DB2 Utilities Solution Pack consists of identifying the pack to customize; selecting components of the pack to customize; defining any required component, LPAR, and DB2 parameters; generating the customization jobs; and submitting the jobs.

Hiding and displaying panel text

After you are familiar with Tools Customizer, you might want to hide the instructions and some of the basic descriptions that are displayed by default on Tools Customizer panels.

About this task

By using the OPTIONS command, you can choose to show or hide the following information on Tools Customizer panels:

- The instructions on all panels
- The Product to Customize section on the Customizer Workplace panel (CCQPWRK)
- The Usage Notes section on the Product Parameters panel (CCQPPRD), the LPAR Parameters panel (CCQPLPR), and the DB2 Parameters panel (CCQPD2).

By hiding this information, more data can be displayed on the panels. Later, you can redisplay this information also by using the OPTIONS command.

Procedure

1. On any Tools Customizer panel, issue the OPTIONS command. The Panel Display Options panel (CCQPOPT) is displayed, as shown in the following figure. By default, all options are preselected with a slash (/) to be shown.
To hide any of the options, remove the slash, and press Enter.

2. To hide any of the options, remove the slash, and press Enter.
Chapter 5. Customizing components in the DB2 Utilities Solution Pack

Using Tools Customizer to customize components in the DB2 Utilities Solution Pack consists of identifying the pack to customize; selecting components of the pack to customize; defining any required component, LPAR, and DB2 parameters; generating the customization jobs; and submitting the jobs.

Customization roadmaps describe the steps that you must complete to customize one or more components in the DB2 Utilities Solution Pack. Separate roadmaps are provided for the three most common types of customizations.

Use the following table to determine which roadmap corresponds to your environment.

<table>
<thead>
<tr>
<th>Environment description</th>
<th>Roadmap</th>
</tr>
</thead>
<tbody>
<tr>
<td>You do not have customized versions of the components in the DB2 Utilities Solution Pack, and you need to customize one or more of them for the first time.</td>
<td>“Roadmap: Customizing components for the first time”</td>
</tr>
<tr>
<td>You already customized one or more components in the DB2 Utilities Solution Pack as stand-alone products. Now, you have installed the DB2 Utilities Solution Pack, and you want to use the same parameter values to customize these components.</td>
<td>“Roadmap: Customizing new versions of components from a previous customization” on page 174</td>
</tr>
<tr>
<td>You have customized versions of the components in the of DB2 Utilities Solution Pack, but you want to change one or more parameter values.</td>
<td>“Roadmap: Recustomizing components” on page 175</td>
</tr>
</tbody>
</table>

**Roadmap: Customizing components for the first time**

This roadmap lists and describes the steps that are required to customize one or more components in the DB2 Utilities Solution Pack for the first time.

If you are customizing a previous version of one or more components in the DB2 Utilities Solution Pack, see “Roadmap: Customizing new versions of components from a previous customization” on page 174.

Before you complete these steps, ensure that the following prerequisites have been met:

- All of the pack customization steps that must be done before Tools Customizer is started are complete.
- The LPAR ISPF libraries that are required to submit the jobs are known.
- Tools Customizer is started.
- The Tools Customizer settings have been reviewed or modified, and saved.
Complete the steps in the following table to customize components for the first time.

Table 12. Steps for customizing for the first time

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
<th>Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Specify the product metadata library for the pack that you want to customize. The name of this library is hlq.SDENU.</td>
<td>“Specifying the metadata library for the pack to customize” on page 177</td>
</tr>
<tr>
<td>2</td>
<td>Select the components of the pack that you want to customize.</td>
<td>“Selecting components to customize” on page 178</td>
</tr>
<tr>
<td>3</td>
<td>Create new DB2 entries and associate them with components of the pack.</td>
<td>“Creating and associating DB2 entries” on page 181</td>
</tr>
<tr>
<td>4</td>
<td>Define the required parameters.</td>
<td>“Defining parameters” on page 183</td>
</tr>
<tr>
<td>5</td>
<td>Generate the customization jobs for the component or for the DB2 entries on which the component is ready to be customized.</td>
<td>“Generating customization jobs” on page 188</td>
</tr>
<tr>
<td>6</td>
<td>Submit the generated customization jobs.</td>
<td>“Submitting customization jobs” on page 189</td>
</tr>
</tbody>
</table>

The following table lists some of the common administrative tasks that you might need to do during the customization process.

Table 13. Administrative tasks

<table>

</tr>
</tbody>
</table>

Roadmap: Customizing new versions of components from a previous customization

This roadmap lists and describes the steps for customizing new versions of components in the DB2 Utilities Solution Pack based on the existing customization values of a previous version of the same components in the pack.

Use this roadmap even if the previous version of DB2 Utilities Solution Pack was not customized by using Tools Customizer.

Before you complete these steps, ensure that the following prerequisites have been met:
All of the pack customization steps that must be done before Tools Customizer is started are complete.

- Tools Customizer is started.
- The Tools Customizer settings have been reviewed or modified, and saved.

Complete the steps in the following table to customize new versions of components in the DB2 Utilities Solution Pack from a previous customization.

Table 14. Steps for customizing new versions of components in the DB2 Utilities Solution Pack from a previous customization

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
<th>Instructions</th>

**Roadmap: Recustomizing components**

This roadmap lists and describes the steps to change parameter values and regenerate customization jobs for components in the DB2 Utilities Solution Pack after you have customized it for the first time.
The new customization jobs will replace the customization jobs that were previously generated and stored in the customization library. Part of the recustomization process includes selecting or deselecting optional tasks or steps, changing the definitions of parameters that have already been defined, or both. Use the method in this roadmap instead of deleting customization jobs from the customization library.

Before you complete these steps, ensure that the following prerequisites have been met:

- All of the pack customization steps that must be done before Tools Customizer is started are complete.
- Tools Customizer is started.

Complete the steps in the following table to recustomize components.

Table 16. Required steps for recustomizing components

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
<th>Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Specify the product metadata library for the pack that you want to recustomize. The name of this library is hlq.SDENU.</td>

Specifying the metadata library for the pack to customize

You must specify a metadata library for the pack that you want to customize.

About this task

The product metadata library contains the information that determines which tasks, steps, and parameters are required to customize DB2 Utilities Solution Pack. This information controls what is displayed on the Component Parameters panel, the LPAR Parameters panel, and the DB2 Parameters panel.

After DB2 Utilities Solution Pack has been SMP/E installed, the default name of the pack metadata library is **high_level_qualifier.SBBYDENU**, where **high_level_qualifier** is all of the segments of the data set name except the lowest-level qualifier.

Procedure

1. Specify option 1 on the Tools Customizer for z/OS panel. The Specify the Metadata Library panel is displayed. This panel contains a list of the product metadata libraries that you specified most recently. If you are using Tools Customizer for the first time, this list is empty, as shown in the following figure:

   **Figure 5. The Specify the Metadata Library panel**

2. Use one of the following methods to specify the pack metadata library:

   - Type the name of a fully qualified partitioned data set (PDS) or an extended partitioned data set (PDSE) in the **Metadata library** field. Double quotation marks ("") cannot be used around the name. Single quotation marks (') can be used but are not required. If you are customizing DB2 Utilities Solution Pack for the first time, you must use this method.
• Place the cursor on the library name in the Recent Metadata Libraries list, and press Enter.

**Results**

The Select the Components to Customize panel is displayed.

**What to do next**

• Select the components of the pack that you want to customize.

---

**Selecting components to customize**

If you are customizing a solution pack, you must select which components of the pack to customize. If you are customizing a product, skip this step.

**Procedure**

1. On the Select the Components to Customize panel, specify `/` next to the names of the components that you want to customize. The following figure shows an example of the Select the Components to Customize panel.

   ![Select the Components to Customize panel](image)

2. Press Enter.

**Results**

If you are customizing components in the DB2 Utilities Solution Pack for the first time, the Run Discover EXEC panel is displayed. Otherwise, the Customizer Workplace panel is displayed.

**What to do next**

Complete the steps that correspond to your environment:

**Customizing components in the DB2 Utilities Solution Pack for the first time**

Do not run the Discover EXEC. Press End. The Customizer Workplace panel is displayed. If your environment requires associated DB2 entries, ensure that they are created and associated. If your environment does not require associated DB2 entries, skip this step, and edit component parameters.
Discovering component information automatically

You can use the Discover EXEC to discover information from a previous or current customization of the component.

About this task

Tip: Using the Discover EXEC to discover information from a previous or current customization saves time and reduces errors that can occur when parameters are specified manually.

The component provides the Discover EXEC that you will run. Therefore, the information that can be discovered depends on the pack.

Parameter values that are discovered and parameter values that are specified manually are saved in the data store. If parameter values for the component that you want to customize exist in the data store, Tools Customizer issues a warning before existing values are replaced.

Procedure

1. On the Customizer Workplace panel, issue the DISCOVER command. If you chose to run the Discover EXEC on the pop-up panel after you specified the component to customize, skip this step.

   Tip: You can run any Tools Customizer primary command by using either of the following methods:
   - Place the cursor on the name of the primary command, and press Enter.
   - Type the primary command name in the command line, and press Enter.

   The Discover Customized Pack Information panel is displayed, as shown in the following figure:
2. Either accept the default values for the following input fields that Tools Customizer generates, or replace the default values with your own values:

   Discover EXEC library
   The fully qualified data set name that contains the Discover EXEC.

   Discover EXEC name
   The name of the Discover EXEC.

   Discover output data set
   The fully qualified data set where output from the Discover EXEC is stored.

3. Either accept or change the default values in the Information for Discover EXEC fields. These fields are generated by the component to be customized. They show the information that is required to run the component Discover EXEC. These fields vary by component.

4. Issue the RUN command to run the component Discover EXEC. Alternatively, save your information without running the component Discover EXEC by issuing the SAVE command. If you issue the RUN command to run the component Discover EXEC, the parameter information is discovered for a component, and the Customizer Workplace panel is displayed.

Results

The discovered parameter values for a component replace any existing values.

What to do next

The next step depends on your environment:

- If DB2 entries were not discovered, or if you need to customize the component on new DB2 entries, create and associate the entries.
- If DB2 entries were discovered and you want to customize the component on only these entries, define the parameters.
Creating and associating DB2 entries

You can create new DB2 entries and associate them with components in the DB2 Utilities Solution Pack.

About this task

The list of associated DB2 entries is on the Customizer Workplace panel.

Procedure

1. Issue the ASSOCIATE command on the Customizer Workplace panel. The Associate DB2 Entry for Component panel is displayed, as shown in the following figure:

   ![Figure 8. The Associate DB2 Entry for Component panel](image)

2. Create DB2 entries. If you need to associate DB2 entries that are already in the master list, skip this step and go to step 3.
   a. Issue the CREATE command. The Create DB2 Entries panel is displayed, as shown in the following figure:

   ![Figure 9. The Create a DB2 Entry panel](image)
b. In the appropriate columns, specify a DB2 subsystem ID, DB2 group attach name, or DB2 data sharing member name for the DB2 entry that you want to create, and press Enter. Valid values are 1 - 4 characters. You can use symbolic characters. You cannot use blanks.

Tips:
- To insert multiple DB2 entries, specify the \texttt{lnn} line command, where \texttt{nn} is the number of DB2 entries to be inserted.
- You will define specific parameters for these new DB2 entries, such as parameters that define a subsystem as primary, on the DB2 Parameters panel. This panel is displayed after you select these new DB2 entries and issue the line command to generate the jobs, after you issue the primary command to generate the jobs for all associated DB2 entries, or when you manually edit the DB2 parameters.

The Associate DB2 Entry for Component panel is displayed, and the new DB2 entry is displayed in the master list, as shown in the following figure:

![Figure 10. The Associate DB2 Entry for Component panel with a new DB2 entry in the master list](image)

c. Repeat steps b and c for each DB2 entry that you want to create.

d. When you have created all the DB2 entries, associate them with the component, or press End to display the Customizer Workplace panel.

3. Associate DB2 entries.

   a. Specify \texttt{A} against one or more DB2 entries in the master list, and press Enter to associate them with the component.

Results

The Customizer Workplace panel is displayed with the associated DB2 entries displayed in the associated list.

What to do next

Define the parameters.

Related concepts:

* "Tools Customizer terminology" on page 275

Tools Customizer uses several unique terms that you should be familiar with.
before you begin to use Tools Customizer.

Defining parameters
To customize a component, you must define component parameters, LPAR parameters, and DB2 parameters, if your customization requires DB2 entries.

About this task
You must define the component parameters first for the following reasons:

- If you ran the component Discover EXEC, you must review the values that were discovered.
- If you select optional tasks and steps on the Component Parameters panel that affect the DB2 entry on which you will customize a component, additional parameters might be displayed on the DB2 Parameters panel.
- If other steps must be completed in a specific sequence, customization notes on the Component Parameters panel will display the correct sequence.

Defining component parameters
Component parameters are specific to a component.

About this task
If you ran the component Discover EXEC, you must review the parameters that were discovered.

Procedure
1. Specify E next to the Component parameters field on the Customizer Workplace panel, and press Enter. The Component Parameters panel is displayed, as shown in the following figure. If other steps must be completed in a specific sequence before you define the component parameters, a note labeled Important will display the correct sequence on this panel.
2. Select any required tasks and steps, and specify values for any parameters. After you select a task or step with a slash (/), put the cursor in the selected field and press Enter. If tasks, steps, and parameters are required, they are preselected with a slash (/). Otherwise, they are not preselected.

All of the required parameters have default values, which you can either accept or change.

Tips:
- In the command line, specify the KEYS command, and map EXPAND to one of the function keys.
- For a detailed description of all input fields, put the cursor in the field, and press F1 or the key that is mapped to Help.
- The following elements apply to specific fields:
  - Add... is displayed when parameters can have multiple values but currently have only one value. To specify multiple values in these fields, place the cursor on Add..., and press Enter. Use the displayed panel to add or delete additional values.
  - List... is displayed when the complete list of valid values for the fields is too long to be displayed on the panel. To see the complete list of values, place the cursor on List..., and press F1 or the key that is mapped to Help.
  - More... is displayed when input fields contain multiple values. To see all of the values in the field, place the cursor on More..., and press Enter.

3. Optional: Select other tasks and steps with a slash (/) and press Enter to activate the input fields. Either accept or change the default values that are displayed.
4. Press End to save your changes and exit, or issue the SAVE command to save your changes and stay on the Component Parameters panel.

**Results**

The Customizer Workplace panel is displayed, and the status of the product parameters is Ready to Customize.

**What to do next**

If the status of other parameters on the Customizer Workplace panel is Incomplete or Discovered, edit these parameters.

**Related tasks:**

- “Defining LPAR parameters”
  LPAR parameters are parameters on the local LPAR that are required to customize a component.
- “Defining DB2 parameters” on page 186
  DB2 parameters are parameters for a DB2 entry.

**Defining LPAR parameters**

LPAR parameters are parameters on the local LPAR that are required to customize a component.

**Procedure**

1. Specify E next to the LPAR parameters field, and press Enter. The LPAR Parameters panel is displayed, as shown in the following figure:

   ![LPAR Parameters panel](image)

   **Figure 12. The LPAR Parameters panel**

2. Specify values for all required parameters that are displayed. Many parameters have default values, which you can either accept or change.

   **Tips:**
   - In the command line, specify the KEYS command, and map EXPAND to one of the function keys.
   - For a detailed description of all input fields, put the cursor in the field, and press F1 or the key that is mapped to Help.

Chapter 5. Customizing components in the DB2 Utilities Solution Pack  185
• The following elements apply to specific fields:
  – Add... is displayed when parameters can have multiple values but
currently have only one value. To specify multiple values in these fields,
place the cursor on Add..., and press Enter. Use the displayed panel to
add or delete additional values.
  – List... is displayed when the complete list of valid values for the fields is
too long to be displayed on the panel. To see the complete list of values,
place the cursor on List..., and press F1 or the key that is mapped to Help.
  – More... is displayed when input fields contains multiple values. To see all
of the values in the field, place the cursor on More..., and press Enter.

The following LPAR parameters can contain 1 - 64 values:
• LPAR macro library
• Message library
• Panel library
• Skeleton library
• ISPF table input library
• ISPF user profile library
• File tailoring output library
• Link list library
• Command procedures library
• Macro library
• Link-edit library
• Load library
• Started task library name

3. Press End to save your changes and exit, or issue the SAVE command to save
your changes and stay on the same panel.

Results

The Customizer Workplace panel is displayed, and the status of the LPAR
parameters is Ready to Customize.

What to do next

If the status of other parameters on the Customizer Workplace panel is Incomplete
or Discovered, edit these parameters.

Related tasks:
“Defining component parameters” on page 183
Component parameters are specific to a component.
“Defining DB2 parameters”
DB2 parameters are parameters for a DB2 entry.

Defining DB2 parameters

DB2 parameters are parameters for a DB2 entry.

About this task

If you did not run the component Discover EXEC, you must create and associate
one or more DB2 entries before you can define the DB2 parameters. For more
information, see “Creating and associating DB2 entries” on page 181.
Procedure

1. Specify E next to one or more DB2 entries in the associated list, which is in the Associated DB2 Entries and Parameter Status section on the Customizer Workplace panel, and press Enter. The DB2 Parameters panel is displayed, as shown in the following figure:

![DB2 Parameters Panel](image)

Many parameters have default values, which you can either accept or change.

2. Specify values for all parameters that are displayed.

Tips:
- In the command line, specify the KEYS command, and map EXPAND to one of the function keys.
- For a detailed description of all input fields, put the cursor in the field, and press F1 or the key that is mapped to Help.
- The following elements apply to specific fields:
  - Add... is displayed when parameters can have multiple values but currently have only one value. To specify multiple values in these fields, place the cursor on Add..., and press Enter. Use the displayed panel to add or delete additional values.
  - List... is displayed when the complete list of valid values for the fields is too long to be displayed on the panel. To see the complete list of values, place the cursor on List..., and press F1 or the key that is mapped to Help.
  - More... is displayed when input fields contains multiple values. To see all of the values in the field, place the cursor on More..., and press Enter.

Many parameters have default values, which you can either accept or change.
3. Press End to save your changes and exit, or issue the SAVE command to save your changes and stay on the same panel.

**Results**

The status of the DB2 entries that you selected on the Customizer Workplace panel is Ready to Customize.

**What to do next**

If the status of other parameters on the Customizer Workplace panel is Incomplete or Discovered, edit these parameters.

**Related tasks:**
- “Defining component parameters” on page 183
  Component parameters are specific to a component.
- “Defining LPAR parameters” on page 185
  LPAR parameters are parameters on the local LPAR that are required to customize a component.

---

**Generating customization jobs**

To generate customization jobs for a component and any associated DB2 entries, issue the GENERATEALL command, or select one or more DB2 entries on which to customize a component.

**Procedure**

Generate the customization jobs by using one of the following methods.

- If you want to generate customization jobs at the component level and for any associated DB2 entries, issue the GENERATEALL command, and press Enter.
- If you want to generate customization jobs for specific DB2 entries, select the DB2 entries by specifying the G line command against them, and press Enter.
  
  The available DB2 entries are in the associated list in the Associated DB2 Entries and Parameter Status section.

**Important:** Regenerating customization jobs will replace any existing jobs, including jobs that you might have manually modified after they were generated.

**Results**

If the status is Incomplete or Discovered for component parameters, LPAR parameters, or DB2 parameters, Tools Customizer automatically starts an editing session for the types of parameters that are required. The session continues until the panel for each type of required parameter has been displayed.

**What to do next**

If an automatic editing session is started, accept the displayed parameter values or define values for the required types of parameters, select optional parameters, tasks, or steps for your environment, and save the parameter values. Otherwise, the customization jobs are generated, and you can submit them.

**Tip:** If the customization jobs are generated, but you are not ready to submit them, you can see them later by issuing the JOBLIST command on the Customizer.
Workplace panel. The JOBLIST command displays the Finish Component Customization panel, which you can use to submit the jobs.

## Submitting customization jobs

Submit the customization jobs to customize a component.

### Before you begin

Ensure that the correct jobs are generated.

### About this task

The following figure shows part of the Finish Component Customization panel. The table on this panel shows the customization jobs that are generated by Tools Customizer. They are grouped by job sequence number.

![Finish Component Customization panel](image)

### Customization jobs for DB2 entries

The members use the following naming convention:

\(<job_sequence_number>\)<job_ID><DB2_entry_ID>
where

**job_sequence_number**

Two alphanumeric characters, A0 - Z9, that Tools Customizer assigns to a customization job. The number for the first template in the sequence is A0, the number for the second template is A1, and so on.

**job_ID** Characters 4 - 7 of the template name, if the template name contains five or more characters. Otherwise, only character 4 is used. The component to be customized assigns the template name.

**DB2_entry_ID**

Two alphanumeric characters, AA - 99, that Tools Customizer assigns to a DB2 entry.

For example, the XYZBNDDB2_entry_ID_1 and XYZBNDDB2_entry_ID_2 jobs are generated from the XYZBNDGR template, and the XYZ4DB2_entry_ID_1 and XYZ4DB2_entry_ID_2 jobs are generated from the XYZ4 template. If the jobs are generated on two DB2 entries, the following member names are listed sequentially: A0BNDGAA, A0BNDGAB, A14AA, A14AB.

**Customization jobs for an LPAR or the component**

The members use the following naming convention:

<job_sequence_number><job_ID>

where

**job_sequence_number**

Two alphanumeric characters, A0 - Z9, that Tools Customizer assigns to a customization job. The number for the first template in the sequence is A0, the number for the second template is A1, and so on.

**job_ID** Characters 4 - 8 of the template name, if the template name contains five or more characters. Otherwise, only character 4 is used. For example, for the XYZMAKE template, the job ID is MAKE. For the XYZM template, the job ID is M. The component to be customized assigns the template name, and it is displayed in the Template column.

For example, the XYZBNDGR job is generated from the XYZBNDGR template, and the XYZ4 job is generated from the XYZ4 template. The following member names are listed sequentially: A0BNDGAR, A14.

**Procedure**

1. Submit the generated customization jobs by following the process that you use in your environment or by using the following method:
   a. Specify B against a customization job or the customization library, and press Enter. An ISPF browsing session is started.
   b. Browse the customization job or each member in the library to ensure that the information is correct.
   c. Run the TSO SUBMIT command.
2. Press End.
Results

The component is customized, and the Customizer Workplace panel is displayed. The status is Customized for the DB2 entries on which the component was customized.

What to do next

You can generate more customization jobs for other DB2 entries, view a list of customization jobs that you previously generated, or recustomize a component.

Browsing parameters

You can browse the component parameters, the LPAR parameters, and the DB2 parameters in read-only mode.

Procedure

1. On the Customizer Workplace panel, specify B next to the Component parameters field, the LPAR parameters field, or the DB2 entry that you want to browse, and press Enter. The panel that corresponds to your specification is displayed.
2. Press End to exit.

Copying DB2 entries

You can copy associated and not associated DB2 entries to other DB2 entries or to new DB2 entries.

About this task

Go to the step that applies to your environment:

- To copy an associated DB2 entry to another associated DB2 entry or to an entry that is not associated, go to step 1.
- To copy an associated DB2 entry to a new entry, go to step 2.
- To copy a DB2 entry that is not associated to a new entry, go to step 3.

Procedure

1. To copy an associated DB2 entry to another associated DB2 entry or to an entry that is not associated, complete the following steps:
   a. Specify C against a DB2 entry in the associated list of DB2 entries on the Customizer Workplace panel, and press Enter. The Copy Associated DB2 Entry panel is displayed.
   b. Select one or more DB2 entries to which information will be copied by specifying the / line command, and press Enter. The Associated column indicates whether the DB2 entry is associated.
   Tip: To copy information into all of the DB2 Entries in the list, issue the SELECTALL primary command, and press Enter. The Copy DB2 Parameter Values panel is displayed.
   c. Specify an option for copying common and product-specific DB2 parameter values. Common DB2 parameter values apply to all DB2 entries for all products that you have customized by using Tools Customizer. Product-specific DB2 parameter values apply only to the product that you are currently customizing.
To copy the common DB2 parameter values and the product-specific DB2 parameter values, specify option 1, and press Enter.

To copy only the product-specified DB2 parameter values, specify option 2, and press Enter.

In some cases, the DB2 parameter values might contain the DB2 subsystem ID as an isolated qualifier in data set names. For example, in the DB01.DB01TEST.DB01.SANILLOAD data set name, the DB01 subsystem ID is isolated in the first and third qualifiers but is not isolated in the second qualifier. When the DB2 subsystem ID is an isolated qualifier in data set names, the Change DB2 Subsystem ID in DB2 Parameter Values panel is displayed. Otherwise, the Customizer Workplace panel is displayed.

d. If the Change DB2 Subsystem ID in DB2 Parameter Values panel is displayed, specify an option for changing the subsystem IDs. Otherwise, skip this step.

- To change the subsystem ID in isolated qualifiers in data set names, specify option 1, and press Enter.
- To use the same subsystem ID in all values, specify option 2, and press Enter.

The Customizer Workplace panel is displayed with the copied associated entry in the list.

2. To copy an associated DB2 entry to a new entry, complete the following steps:

a. Specify C against a DB2 entry in the associated list of DB2 entries on the Customizer Workplace panel, and press Enter. The Copy Associated DB2 Entry panel is displayed.

b. Issue the CREATE command. The Create DB2 Entries panel is displayed.

c. Specify the SSID, the group attach name, or both in the appropriate columns for each new DB2 entry, and press Enter.

Tip: To add rows for additional entries, specify the Inn line command, where nn is the number of entries to be created, and press Enter.

The Copy Associated DB2 Entry panel is displayed with the new entries in the list. The new entries are preselected.

d. Press Enter to complete the copy process. The Customizer Workplace panel is displayed with the copied entries in the list.

3. To copy a DB2 entry that is not associated to a new entry, complete the following steps:

a. Issue the ASSOCIATE command on the Customizer Workplace panel. The Associate DB2 Entry for Product panel is displayed.

b. Select one or more DB2 entries by specifying the / line command, and press Enter. The Copy a DB2 Entry panel is displayed.

c. Specify the SSID, the group attach name, or both in the appropriate columns for the new DB2 entry, and press Enter. The Associate DB2 Entry for product panel is displayed with the copied entry in the list.

d. If you want to associate the copied entry, specify A against it, and press Enter. The Customizer Workplace panel is displayed with the copied entries in the list.

What to do next

Edit any of the parameters or generate the jobs.

Related concepts:
Removing DB2 entries

You can remove DB2 entries from the associated list.

About this task

When you remove DB2 entries from the associated list, any customization jobs for the entries are removed from the list of jobs on the Finish Component Customization panel, and they are deleted.

Procedure

On the Customizer Workplace panel, specify R next to one or more DB2 entries that you want to remove, and press Enter. The selected DB2 entries are removed from the associated list and added to the master list on the Associate DB2 Entry for Component panel, and the customization jobs are deleted.

Related concepts:

“Tools Customizer terminology” on page 275

Tools Customizer uses several unique terms that you should be familiar with before you begin to use Tools Customizer.

Deleting DB2 entries

You can delete DB2 entries from the master list.

About this task

When you delete DB2 entries from the master list, any associations and all customization jobs for components that are customized on the entries will be deleted.

Procedure

1. On the Customizer Workplace panel, issue the ASSOCIATE command. The Associate DB2 Entry for Component panel is displayed.
2. Specify D next to one or more DB2 entries that you want to delete, and press Enter. If the entry is associated with any components, the Delete Associated DB2 Entry panel for the first DB2 entry that you selected is displayed. Otherwise, the Delete DB2 Entry panel is displayed.
3. To delete the DB2 entries, press Enter. If the DB2 entries are associated with any components in the table on the Delete Associated DB2 Entry panel, any associations and all customization jobs for the components that are customized on it are deleted. Otherwise, only the DB2 entries are deleted. If you selected multiple DB2 entries to delete, the next DB2 entry that you selected is displayed on either the Delete Associated DB2 Entry panel or the Delete DB2 Entry panel. Otherwise, the Associate DB2 Entry for Component panel is displayed.

What to do next

If you selected multiple DB2 entries to delete, repeat step 3 until all selected entries are deleted. Then, continue the customization process.
Displaying customization jobs

You can view a list of the members that contain the customization jobs before or after you submit the jobs.

About this task

The customization jobs that you generate for one DB2 entry are also displayed when you customize a component for another DB2 entry later.

Procedure

On the Customizer Workplace panel, issue the J0BLIST command. The Finish Component Customization panel is displayed. This panel shows the list of jobs that you have previously generated. They are grouped by job sequence number. Use this panel to browse or edit the generated jobs before you submit them.

Maintaining customization jobs

Instead of deleting customization jobs outside of Tools Customizer, you can maintain the correct jobs for a component by completing the steps for recustomization.

About this task

You cannot delete or rename customization jobs from the customization library by starting an ISPF browse or edit session from the Finish Component Customization panel. If you try to delete customization jobs by using this method, the CCQC034S message is issued. If you try to rename customization jobs, the CCQC035S message is issued.

If you delete or rename customization jobs from the customization library by using ISPF outside of Tools Customizer, Tools Customizer will not recognize that the jobs were deleted, and the Finish Component Customization panel will still display them. If you browse or edit jobs that were deleted from the library outside of Tools Customizer, the CCQC027S message is issued.

Procedure

To maintain the correct customization jobs in the customization library, complete the steps for recustomization.

Using Tools Customizer in a multiple-LPAR environment

Currently, Tools Customizer supports only the local LPAR; however, you can propagate customizations to additional LPARs by using either of two different methods.

About this task

In a multiple-LPAR environment, Tools Customizer identifies the LPAR to which you are logged on. Tools Customizer uses this LPAR name for several different parameter settings, one of which is the data store. When you use the data store during the customization of the component that is on a different LPAR, Tools Customizer issues message CCQDS86S, which indicates that the product has
already been customized based on values from the data store on the first LPAR.
This message is issued to prevent the data store from becoming corrupted.

This behavior occurs in the following conditions:
- Tools Customizer is installed on a DASD device that is shared by multiple
  LPARs.
- After a product is customized by using Tools Customizer, the data store is
copied to another LPAR.

Procedure

To customize products running against a DB2 subsystem on an LPAR where Tools
Customizer is not installed, consider using one of the following methods:

**Install one instance of Tools Customizer on one LPAR**
If you intend to reuse the customization values for all the instances of your
products on all LPARs, use this method.
1. Associate all the DB2 entries in this one instance of Tools Customizer.
The LPARs on which the DB2 subsystems reside do not matter.
2. Generate the customization jobs for each DB2 entry.
3. Copy the generated customization jobs to the LPAR to run against the
specific DB2 entries. Some LPAR-specific edits might be required. You
can make these edits in the customized jobs that you copied. Note that
this situation is one of the few situations where you might need to
make manual changes to the jobs that are customized by Tools
Customizer.

**Install one instance of Tools Customizer on each LPAR**
If you do not want to reuse previous customization values and you want
to start new customizations, use this method.

**Important:** This method will likely not be the preferred approach for most
organizations because most organizations tend to use similar or identical
customization values for each product instance on all LPARs.
Chapter 6. Post-customization tasks

After you customize the components of the solution pack, some components have post-customization tasks that you might need to perform depending on the environment that you want to set up.

Post-customization tasks: DB2 Automation Tool

After you customize DB2 Automation Tool, you might want to complete the task in this section.

Creating multiple configurations of DB2 Automation Tool

DB2 Automation Tool V4.2 allows multiple configurations of itself to be installed on the same subsystem. Each configuration has its own CLIST, data repository, and set of plans and packages. The configurations share the same set of DB2 Automation Tool execution libraries; each configuration is identifiable by a three-character user indicator in the CLIST. This allows an installation to, for example, have a test version of DB2 Automation Tool in the same subsystem as a production version.

About this task

If multiple configurations are desired, you must completely customize one configuration using IBM Tools Customizer and then repeat the customization process using Tools Customizer for each subsequent configuration. Each configuration must have a unique HAA configuration value as specified on the Tools Customizer Product Parameters panel; this value becomes the user indicator parameter (USERIND) in the product CLISTS.

The following procedure illustrates the process for two configurations.

Procedure

1. Make a separate copy of the product metadata data set (hilevel.SHAADENU) for each configuration that will be created. For product configuration number 1, create a copy of the product metadata data set; for example, it could be named DB2TOOL.PRD.CFG01.SHAADENU. For product configuration number 2, create a copy of the product metadata data set called (for example) DB2TOOL.PRD.CFG02.SHAADENU.

2. Customize product configuration number 1:
   a. Start Tools Customizer.
   b. On the Tools Customizer main menu, select Option 0 (Settings) and enter the desired customization library qualifier. This value should be different for each configuration. For example, it could be called DB2TOOL.PRD.CFG01, following the naming convention in this example. Save and exit.
   c. On the Tools Customizer main menu, select option 1.
   d. On the Specify the Product to Customize panel, enter DB2TOOL.PRD.CFG01.SHAADENU in the Product metadata library field.
e. If you want to discover information from a previous installation of DB2 Automation Tool, run Discover. The HAA configuration value will be input as a Discover parameter. If you do not run Discover, the HAA configuration value defaults to “HAA”.

f. On the Product Parameters panel, take note of the HAA configuration value for this configuration. Subsequent configurations will require a different value.

g. Generate customized jobs against each SSID. Tools Customizer will generate the jobs in DB2TOOL.PRD.CFG01.$lpar$.HAA420.

3. Customize product configuration number 2:
   a. Navigate to the Tools Customizer main menu (CCQPHME).
   b. On the Tools Customizer main menu, select option 0 (Settings) and enter a different customization library qualifier; for example, DB2TOOL.PRD.CFG02 (continuing the example naming convention). Save and exit.
   c. On the Tools Customizer main menu, select option 1.
   d. On Specify the Product to Customize panel, enter the data set name for the second configuration's copy of the metadata, DB2TOOL.PRD.CFG02.SHAADENU, in the Product metadata library field.
   e. If you want to discover information from a previous installation of DB2 Automation Tool, run Discover. The HAA configuration value will be input as a Discover parameter. If you do not run Discover, the HAA configuration value defaults to “HAA”.
   f. On the Product Parameters panel, ensure that the HAA configuration value is different from the configuration value specified in product configuration number 1.
   g. Generate customized jobs against each SSID. Tools Customizer will generate the jobs in DB2TOOL.PRD.CFG02.$lpar$.HAA420.

What to do next

You can repeat this procedure for as many configurations as you required. Each configuration must have its own set of metadata files and a unique HAA configuration value.

---

Post-customization tasks: DB2 High Performance Unload

After you customize DB2 High Performance Unload, you might want to complete the tasks in this section.

Optional: Integrating DB2 HPU into DB2 Tools Launchpad

Optionally, you can integrate DB2 HPU into DB2 Tools Launchpad. Tools Customizer will create the necessary JCL, but you must manually complete some steps after you submit the customization job.

Before you begin

Before you complete these steps, ensure that the following prerequisites have been met:

- The DB2 Tools Launchpad is installed.
- Tools Customizer generated the job from the INZLAUNC template, and you submitted the job.
About this task

The DB2 Tools Launchpad is a centralized panel from which you can launch integrated DB2 Tools. After you integrate DB2 HPU, you can launch DB2 HPU from the DB2 Tools Launchpad.

Procedure

1. Run the CLIST INZADBI in SINZCLST. The CLIST uses the high-level qualifier that you specify for the DB2 Admin data sets and the name of the library that contains the ADBDMTI EXEC. The DB2 Tools Table – ADD An Entry panel is displayed, as shown in the following figure:

   ![DB2 Tools Table - ADD An Entry panel](image)

   **Figure 15. Adding an entry to the DB2 Tools Launchpad panel**

2. Press Enter to confirm the new DB2 HPU command.

Results

When INZADBI completes successfully, a new line, HPU, is added to the DB2 Tools Launchpad.

Optional: Integrating DB2 HPU into DB2 Administration Tool

Optionally, you can integrate DB2 HPU into DB2 Administration Tool (DB2 Admin). Tools Customizer will create the necessary JCL, but you must manually complete some steps after you submit the customization job.

Before you begin

Before you complete these steps, ensure that the following prerequisites have been met:

- DB2 Admin is installed.
- Tools Customizer generated the job from the INZADTOO template, and you submitted the job.

About this task

DB2 Admin helps you manage DB2 environments efficiently and effectively. After you have integrated DB2 HPU, you can run DB2 HPU unload operations by using DB2 Admin.
Procedure
1. Follow the instructions that are described in INZDB21X in the SINZCLIST library. You can customize these instructions by changing the name of the library which contains DB2 Admin commands tables and the name of the library which contains the ADBDMTI EXEC.

   Requirement: Before you can use the INZDB21X member, you must generate it with Tools Customizer whenever you change the library names.

2. Run the ADB21S and ADB21T procedures that you have modified. These procedures are used to re-create the DB2 Admin Tool command tables.

Results
When ADB21S and ADB21T complete successfully, you can start DB2 HPU interactively by using the DB2 Admin.

Post-customization tasks: DB2 Sort
After you customize DB2 Sort, you must create access to the DB2 Sort libraries. You can then use the Installation Verification Program to test your settings before moving DB2 Sort to a production environment.

Accessing DB2 Sort libraries
After activating and customizing DB2 Sort, you must create access to the following DB2 Sort libraries: SCNKLINK and SCNKLPA. If access to these two libraries was established before you began this customization, then ignore the procedure that follows and refresh the library by using the following MVS system command:
MODIFY LLA, REFRESH

Procedure
Decide how you want to access the DB2 Sort libraries, SCNKLINK and SCNKLPA. To make these decisions, consider the following information about the attributes of the DB2 Sort libraries:
• The SCNKLINK and SCNKLPA libraries can be in the LNKLST.
• The SCNKLPA library can be in the LPA, but it is not required to be in the LPA.
• If the SCNKLPA library is not in the LPA, it must be APF-authorized.
• The SCNKLINK library must be APF-authorized.

What to do next
You can submit the Installation Verification Program job that you generated with Tools Customizer to test your product configuration before moving to a production environment. After the IVP job runs to completion, refer to the procedure to generate an IVP report in “Generating an IVP report” on page 202.

After the product has been successfully installed and configured and the load library is APF-authorized, you may begin using DB2 Sort. Refer to the sample job in *DB2 Sort for z/OS User’s Guide.*
Installation Verification Program: Overview

Installation Verification Program (IVP) is a program you can run in a test environment to verify your DB2 Sort installation prior to moving to a production environment.

DB2 Sort IVP is a self-contained evaluation and testing methodology you can use to determine that DB2 Sort is installed correctly and performing properly.

When you run IVP, it performs the following tasks:

- Creates a storage group and database for the IVP objects and then drops them at the end of the job
- Creates tables with different sizes and row lengths, and multiple indexes and index lengths
- Ensures data is not in clustering sequence
- Executes the LOAD, REBUILD INDEX, and REORG utilities with and without DB2 Sort

When you are customizing DB2 Sort with , you can choose the cases for IVP. There are four table sizes: 8 billion bytes, 10 billion bytes, 25 billion bytes and 40 billion bytes. Base your decision on the amount of disk space and time you want the job to use.

To ensure that the IVP results are meaningful, you must run IVP in an appropriate test environment that represents your production environment as much as possible.

Use the following general requirements when setting up your test environment:

- **CPU**: 2 general purpose processors minimum, preferably 4 or more; 1 or more zIIP processors
- **DASD**: Minimum of 6 volumes (PAV-capable)
- **Channels**: Minimum of 6 (quiet)
- **Memory**: Minimum of 10 GB
- **LPAR**: Stand-alone or quiet system
- **Traces**: Turn off all DB2 Utility traces that impact performance times

Using Installation Verification Program

Use the Installation Verification Program (IVP) in a test environment to verify that your DB2 Sort installation and any customizations you made are functioning correctly before moving to a production environment.

Before you begin

Make sure that DB2 Sort has been installed and you have an appropriate test environment. For details about setting up the test environment, see “Installation Verification Program: Overview.”

Since information about the IVP job will be recorded in SMF records and performance trace data, you must ensure that your system is set up to generate the performance trace data, using the following requirement:

- Issue the following DB2 command to collect performance trace data:
  
  -START TRACE(P) DEST(SMF) CLASS(30) IFCID(25) TDATA(COR,CPU)
Note: Issue a DISPLAY TRACE(*) first. If another active trace with CLASS(30) has started, you will need to issue a START TRACE(P) CLASS(31) or (32). If all three classes are in use, add IFCID(25) using a MODIFY TRACE command. Alternatively, you can issue the STOP TRACE(P) command and reissue the START TRACE(P), combining the different IFCIDs into the single START TRACE(P) command.

If you have generated the IVP job with Tools Customizer, submit the job after you have set up your environment to generate the performance trace data and after your DB2 Sort libraries have been made accessible. For instructions on making your libraries accessible, see “Accessing DB2 Sort libraries” on page 200.

Generating an IVP report
After you run one of the IVP jobs, you can generate a report to display the results.

About this task
The report program uses SMF type 30 subtype 4 and DB2 SMF 102 (IFCID 25) records as input.

To display the spreadsheet located in the SCNKBNENE library, a PC/workstation with a program that can edit spreadsheets from Microsoft Office Excel 2003 (XLS format) or later is required.

Procedure
1. Extract the SMF type 30 subtype 4 records and the SMF 102 records from your SMF data sets and put them into a single data set. You can use the IFASMFDP program to create the data set.
2. If DB2 SMF records are in compressed format, you must decompress the SMF records prior to using the reporter job with the SMF decompression program DSNTSMFD.

Note: For more information about the SMF decompression program DSNTSMFD, refer to:
- DB2 11 for z/OS Utility Guide and Reference (SC19-4067)
- DB2 10 for z/OS Utility Guide and Reference (SC19-2984)

For DB2 10 the SMF decompression program is provided with PTF UK64597.
3. Open the CNKIVRPT member which is located in the SCNKSNMP library.
4. Make the editing changes according to the instructions that are included in the JCL and submit the job. This job creates an output file named userid.CNKDATA.TXT.
5. Transfer your userid.CNKDATA.TXT file to a PC/workstation in ASCII mode, renaming it to c:\temp\cnkdata.txt.

Note: If your transfer facility offers a carriage return/line feed option (CRLF), it should be selected.
6. Transfer the member named CNKIVXLS which is located in the SCNKBNENE library to a PC/workstation in binary mode, renaming it to cnkivxls.xls.
7. On the PC/workstation, open the cnkivxls.xls spreadsheet. Enable content in response to the security warning. Select the Worksheet tab and follow the directions within the worksheet.
Results

The IVP report program produces the following two reports:

- Summary
- Details

After the worksheet has been filled in, choose the Summary and Details tabs to view the reports.

What to do next

After the product has been successfully installed and configured and the load library is APF-authorized, you may begin running DB2 utilities and tools with DB2 Sort.

Post-customization tasks: DB2 Utilities Enhancement Tool

After you customize DB2 Utilities Enhancement Tool, complete the post-customization tasks. Some of these tasks are required, and some are optional. Table 18 lists the tasks.

<table>
<thead>
<tr>
<th>Task</th>
<th>Required or optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Setting up the initialization options member (optional)”</td>
<td>Optional</td>
</tr>
<tr>

<td>Required</td>
</tr>
</tbody>
</table>

Setting up the initialization options member (optional)

The initialization options member, called *abpidOPTS*, is used by the DB2 UET started task upon initialization.

About this task

Tools Customizer already customized the options member for the ABPID that you specified in the Tools Customizer panels, if you selected the task Create the Options Module. If you plan to run multiple started tasks to monitor different DB2 subsystems, you are required to create separate initialization options members for each one. This customization step is required if you will use multiple started tasks.
This member resides in the hlq.mlq.SABPSAMP data set and is identified in the started task’s ABPOPTS DD statement of the PROC (abpidPROC). The following example of the abpidOPTS member specifies the following options in XML:

```xml
<?XML VERSION="1.0" ENCODING="UTF-8"?>
<!DOCTYPE OPTIONS SYSTEM "DD:DTD(ABPDTDOP)">
<![--  ****************************************************** -->]
<OPTIONS
  ABPBMAIN_CANCEL_MEMBER="abpidBCAN"
  ABPBMAIN_GLOBAL_MEMBER="abpidBGLB"
  ABPID="abpid"
  AUDIT_ACTIVE="YES"
  AUDIT_MAX_AGE="0"
  CANCEL_ESCALATION_ACTIVE="NO"
  DB2_CONNECT_TO_ALL_SUBSYSTEMS="YES"
  DB2_CONNECTION_IDLE_TIMEOUT="300"
  DB2_PLAN_NAME="plan_name"
  DB2_SSLID="subsystem_identifier"
  DB2_TASK_COUNT="2"
  DB2_TASK_IDLE_TIMEOUT="900"
  DYNAMIC_SYSOUT_CLASS="*"
  LOGGING_ACTIVE="YES"
  LOGGING_MAX_AGE="0"
  WORK_DATABASE_BUFFERPOOL="bufferpool_name"
  WORK_DATABASE_NAME="database_name"
  WORK_DATABASE_STOGROUP="stogroup_name"
  OVERRIDE_MAPPING_TABLE="value"
  POST_CANCEL_EXIT="NONE"
  PRE_CANCEL_EXIT="NONE"
  SECURITY_EXIT="NONE"
  SVC_NUMBER="svc_number"
  TRACE_ACTIVE="YES"
  TRACE_SIZE="1"
  WORKFILE_DATACLASS="data_class"
  WORKFILE_MGMTCLASS="management_class"
  WORKFILE_STORCLASS="storage_class"
  WORKFILE_UNIT="unit_name"
  WORKLIST_ERROR_MAX_AGE="0"
  WTO_ROUTCDE="11"
/> --]
```

Tools Customizer set values for many of these options based on the values that you specified in the customization dialogs. You can edit these values, if necessary. Make sure that you edit the abpidOPTS member that was generated for your started task configuration rather than the original initialization options member (ABPOPTS), which also resides in the hlq.mlq.SABPSAMP library.

When editing the initialization options member, consider whether an option is required or optional. Only the following options are required and must be present in the started task initialization options member:

- ABPID
- DB2_PLAN_NAME
- DB2_SSLID
- WORK_DATABASE_NAME
- SVC_NUMBER

All other options are optional because they have default values. If you omit an “optional” option from the initialization options member, DB2 UET uses the default value for that option.
Tip: You will be able to temporarily override the values for the following options from the Control System panel in the ISPF interface: AUDIT_ACTIVE, LOGGING_ACTIVE, TRACE_ACTIVE, WORKFILE_DATACLAS, WORKFILE_MGMTCLAS, WORKFILE_STORCLAS, WORKFILE_UNIT, and WTO_ROUTCDE. Any changes that you make from this panel are retained only until you restart the started task. The changes are not saved to the initialization options member.

What to do next

If you would like to prevent users from being able to cancel threads using DB2 UET, you may create a security exit that is invoked each time a thread cancel command is issued. See task “Creating a security exit (optional)” on page 210.

APF-authorizing the load library

Ensure that the product load library is APF-authorized so that it will be available for use. This customization step is required.

About this task

DB2 UET requires that the product load library (hlq.mlq.SABPLOAD) be authorized by the z/OS Authorized Program Facility (APF). To include this load library in your system APF-authorized list, issue the following z/OS operator command:

```
SETPROG APF,ADD,DNAME=hlq.mlq.SABPLOAD,VOLUME=volser
```

Where

- `hlq` is the high-level qualifier.
- `mlq` is the mid-level qualifier that you specified when you ran Tools Customizer.
- `volser` is the volume serial number of the DASD device where the SABPLOAD library resides.

Copying the started task PROC

Copy the DB2 UET started task PROC to your system PROCLIB to make the started task address space available to the user interfaces for the product. This customization step is required.

About this task

Run the A6MODCR job located in the data set that is specified in the Product Customization Library field on the Tools Customizer Finish Product Customization panel. This job will create the `abpidPROC` member in your `hlq.mlq.SABPSAMP` library. This job was only created if you selected the Tools Customizer subtask Create BCAN, BGLB, PROC, PLCY Members.

Procedure

1. Copy the `abpid` PROC member that gets created in the `hlq.mlq.SABPSAMP` to a member in your system PROCLIB.
2. In the EXEC statement, ensure that `REGION=0M` is specified to avoid storage problems. Also, ensure that `TIME=1440` is specified to allow DB2 UET to run for an unlimited amount of time.
3. Ensure that the STEPLIB and SVCLIB data sets are APF-authorized.
4. If you plan to monitor threads across multiple DB2 subsystems that have different DB2 versions, ensure that the STEPLIB concatenation specifies the
lowest (earliest) of these DB2 versions as the DSNLOAD library. Otherwise, connection problems might occur when you attempt to manage threads on DB2 subsystems other than the primary subsystem that contains the audit and logging tables.

What to do next

Copy the DSNUTILF module from the hlq.mlq.SABPLOAD product library to a STEPLIB or JOBLIB DD that is used in your DB2 utility jobs. See the task “Copying the DSNUTILF module” on page 210.

Customizing DSNUTILB intercept parameters (optional)

If you plan to use the DSNUTILB intercept, you can customize the cancel parameters and global parameters that the DSNUTILB intercept will use for all thread blocking and cancelation activities. These parameters are specified in the SABPSAMP members abpidBCAN and abpidBGLB. This customization step is optional.

About this task

Tools Customizer created a job called A6MODCR that in turn creates the abpidBCAN and abpidBGLB members (where abpid is the value that you specified in the Tools Customizer field DB2 UET Configuration Name) in the hlq.mlq.SABPSAMP library for your started task configuration. The DB2 UET provides default values for all of the parameters in these members. Normally, you customize these members only if you want to override the default behavior.

If you omit a parameter from one of these members, DB2 UET will use the default value for that parameter. If you specify an invalid value for a parameter, any thread blocking and cancelation processing that the DSNUTILB intercept attempts to perform will fail.

Tip: You can edit these members while the started task is running and performing interception to correct any syntax errors or change parameter settings. However, for your revisions to take effect for an intercepted DB2 utility, you will need to re-run the utility.

Procedure

1. Edit the values for any of the following parameters in the abpidBCAN member, or accept the default values. These parameters pertain to each cancel request. You cannot add comments to this member or specify additional parameters.

   CANCEL_TYPE BACKOUT|NOBACKOUT|NO_UR_CHECKING

   One of the following types of cancelation processing:

   Important: The NOBACKOUT and NO_UR_CHECKING cancel types are not supported for threads on a DB2 subsystem other than the local subsystem to which a connection is established based on the <DB2SYSTEM> element value in the intercept policy. In a DB2 data sharing environment, these options do not apply to other subsystems in the data sharing group.

   • BACKOUT: Specify this option to have DB2 back out (roll back) any uncommitted work that exists in the current unit of recovery when a thread is canceled. This backout processing ensures that the data
integrity of the updated DB2 objects is maintained. Any updates that occurred after the last commit operation are backed out. This option is the default option.

• **NOBACKOUT: Do not specify this option if possible.** This option causes DB2 UET to check for any outstanding units of recovery just prior to canceling threads but prevents DB2 from performing backout processing. If DB2 UET finds an outstanding unit of recovery for a thread, the thread is not canceled and the return code RC12 is issued. Depending on how you set the ON_FAILURE parameter in the abpiddBGLB member, the cancel request either terminates or continues to the next thread. By default, the request will continue and cancel the other threads. If DB2 UET does not find an outstanding unit of recovery, the thread is canceled. In this situation, data integrity problems can occur if an outstanding unit of recovery is created for a thread after DB2 UET has determined that no outstanding units of recovery exist for the thread and before the thread is canceled. Therefore, use this option with caution.

• **NO_UR_CHECKING: Do not specify this option unless necessary.** This option causes threads to be canceled without backout processing or any checking for outstanding units of recovery prior to cancelation. All threads that match your thread-filtering criteria are canceled, even if outstanding units of recovery exist for them. This situation is likely to result in data corruption in your database. (This option is equivalent to using the DB2 NOBACKOUT option on the -CANCEL THREAD command. For more information about the DB2 NOBACKOUT option, see the *IBM DB2 Version 10 for z/OS Command Reference*.)

**ESCALATE YES|NO**

Whether DB2 UET issues the z/OS Cancel command to cancel a thread when the DB2 -CANCEL THREAD command fails to do so. If you set this parameter to YES, DB2 UET can issue the z/OS Cancel command to terminate the TSO user, batch job, or started task from which the thread originated. This escalated cancelation processing is supported only for the following connection types: CAF, IMSLIBT, RRSAF, and TSO. Also, in a DB2 data sharing environment, escalated cancelation is supported only for threads on a local subsystem that you specify in a DB2SYSTEM element of the intercept policy. If you set this parameter to NO, DB2 UET issues the DB2 -CANCEL THREAD command but does not escalate cancelation processing to the z/OS Cancel command when the DB2 -CANCEL THREAD command fails to terminate a thread; any threads that were not canceled remain active. The default value is NO.

**Important:** DB2 UET will not perform an escalated cancelation, even if you set the ESCALATE parameter to YES, if a thread has a connection type that is not supported for escalated cancelation processing or if the CANCEL_ESCALATION_ACTIVE option in the started task initialization options member is set to NO.

**CHECK_THDTERM_RETRY_COUNT integer**

After issuing the DB2 -CANCEL THREAD command, DB2 UET checks the status of the canceled threads to determine whether DB2 has actually terminated them. If some threads are not yet terminated, DB2 UET continues to check the thread status until all of the canceled threads are actually terminated or until the maximum retry count that you set with this parameter is reached. If the maximum retry count is reached and a thread has still not been terminated, DB2 UET issues an error message with the appropriate return code. If you also set the ESCALATE parameter to YES,
DB2 UET will then issue the z/OS Cancel command to terminate the thread. Valid values are from 1 through 32,767. The default value is 20.

**Tip:** Set the CHECK_THDTERM_RETRY_INTERVAL parameter to define how frequently thread-status checking occurs.

**CHECK_THDTERM_RETRY_INTERVAL** *seconds*
How often (in seconds) DB2 UET checks the status of the threads that have been canceled to determine whether they are actually terminated in DB2. Valid values are from 1 through 32,767. The default value is 3.

**Tip:** Set the CHECK_THDTERM_RETRY_COUNT parameter to define the maximum number of times that DB2 UET will attempt thread-status checking.

2. Edit the values for any of the following parameters in the abpidBGGL member, or accept the default values. These global control parameters pertain to all thread blocking and cancelation activities that the DSNUTILB intercept will perform. You cannot add other parameters to this member.

**ESCAPE** *(character)*
The escape character that you want to use to delimit a wildcard character in a intercept policy rule for selecting threads for cancelation when that character is used as an actual part of the data value and not as a wildcard. If you do not specify the escape character immediately before such a character, DB2 treats the character as a wildcard when performing pattern matching during thread filtering. (For more information about escape expressions and pattern matching, see the IBM DB2 Version 10 for z/OS SQL Reference.) The default escape character is the plus sign (+). This parameter is ignored in environments that use a double-byte character set (DBCS).

**EXEC_TYPE** *(CHECKPARMS|EXECUTE|SIMULATE)*
One of the following execution modes for thread-cancelation processing:
- **CHECKPARMS:** Specify this option to have DB2 UET validate the syntax of all of the input parameters that are specified without actually blocking and canceling any threads. The DB2 utility will still run although no threads are canceled.
- **EXECUTE:** Specify this option to actually perform thread blocking and cancelation. All threads that are selected based on the EXCLUDE and INCLUDE rules that you define in the DSNUTILB intercept policy will be blocked and canceled. This option is the default option.
- **SIMULATE:** Specify this option to perform a trial run of thread-cancelation processing for a utility. DB2 UET simulates the cancelation of threads that are selected based on the EXCLUDE and INCLUDE rules that you define in the DSNUTILB intercept policy. The processing flow, messaging, and reporting are the same as if you specified the EXECUTE mode, but no threads are actually blocked and canceled. You can use this option to pre-check which threads will be canceled and to troubleshoot potential errors. The DB2 utility will still run although no threads canceled.

**ON_FAILURE** *(CONTINUE|TERMINATE [RESET_OBJECT_STATUS YES|NO]*)
Whether thread-cancelation processing continues or terminates when an error occurs. By default, when an error occurs, the thread-cancelation processing continues. However, if you specify TERMINATE for this parameter, the job will terminate and no additional cancel processing will occur.
You can add a subparameter on the TERMINATE option to specify whether DB2 UET reinstates the original statuses of the DB2 objects when cancelation processing fails or one or more of the canceled threads do not actually terminate. During thread blocking, DB2 UET changes the statuses of the DB2 objects to either RO (read only) or UT (only the utility for which threads are being canceled has access). You can control whether DB2 UET leaves the object statuses in this state after a cancel failure by adding the RESET_OBJECT_STATUS subparameter, as follows:

ON_FAILURE (TERMINATE RESET_OBJECT_STATUS YES|NO)

If you accept the default value of YES for this subparameter, DB2 UET reinstates the original statuses of the objects. If you specify NO, DB2 UET retains the object statuses that were in effect during thread blocking. This subparameter applies only to thread-cancel operations that include thread blocking.

REPORT_TYPE (SUMMARY|DETAIL)

The level of reporting that DB2 UET provides for actual or simulated runs of thread-cancelation processing. DB2 UET can generate up to five reports for each cancel request for a utility. Valid options are:

- SUMMARY: Specify this option to print the Threads Canceled report and the Threads Canceled Unit of Recovery report for each cancel request for which active threads are selected for cancelation. This option is the default option.
- DETAIL: Specify this option to print the following five reports for each cancel request: the Threads Canceled report, the Threads Canceled Unit of Recovery report, the All Active Threads report, the All Active Threads Unit of Recovery report, and the All Active Threads Objects Referenced report. If no threads are selected for cancelation processing for a cancel request, DB2 UET generates only the three reports on all active threads.

THREAD_QUIESCE_TIME (seconds)

For thread-blocking actions, you can specify the number of seconds that DB2 UET waits between initiating thread blocking and canceling the active threads that are identified by EXCLUDE and INCLUDE rules that you define in the DSNUTILB intercept policy. This interval is intended to allow the applications that are using the existing threads to complete units of work or quiesce prior to thread cancelation. If you do not specify this parameter, the default value of 0 is used, which causes DB2 UET to cancel existing threads immediately after initiating thread blocking.

3. If you copied the abpidBCAN and abpidBGLB members under other names before editing them, make sure that you specify the new member names in the started task initialization options member (abpidOPTS). The ABPBMAIN CANCEL MEMBER and ABPBMAIN GLOBAL MEMBER options in the abpidOPTS member must correctly reference the abpidBCAN and abpidBGLB members for the started task to use these parameters for thread-cancelation processing for intercepted DB2 utilities.

What to do next

Optionally, make any necessary edits to the options module created by Tools Customizer. See task "Setting up the initialization options member (optional)" on page 203.
**Copying the DSNUTILF module**

If you plan to use the DSNUTILB intercept, copy the DB2 UET DSNUTILF load module to a data set in the STEPLIB or JOBLIB concatenation for your DSNUTILB utility jobs.

**About this task**

This customization step is required for the DB2 UET started task to perform DSNUTILB interception services.

**Procedure**

1. Copy the DSNUTILF module into one of the APF-authorized libraries in the STEPLIB/JOBLIB concatenation.

2. Optionally, you can copy the DSNUTILF module to a data set other than RUNLIB.LOAD, SDSNEXIT or SDSNLOAD. If you choose this method, ensure that the data set is APF-authorized and is contained in the JOBLIB of your utility job or in the STEPLIB of the DSNUTILB jobsteps.

3. Depending on how you invoke DSNUTILB, you might also need to specify the target data set at the following locations:
   - If you plan to invoke DSNUTILB by using the DSNUTILS or DSNUTILU stored procedure, concatenate the DB2 UET LOAD library to the STEPLIB/JOBLIB concatenation.
   - If you plan to invoke DSNUTILB from a TSO or ISPF session, specify the target data set name in the STEPLIB or ISPLLIB concatenation for your TSO or ISPF sessions.

**Results**

Note that with the DSNUTILF module in the load library concatenation, the DSNUTILB program will still be able to operate normally even if the DB2 UET STC becomes unavailable or if the DB2 UET intercept policy prevents DSNUTILB interception.

**What to do next**

Optionally customize the DSNUTILB interception parameters. See task “Customizing DSNUTILB intercept parameters (optional)” on page 206.

**Creating a security exit (optional)**

If you want to control user access to product commands for intercept processing and to certain ISPF panels, you can create a security user exit. This customization step is optional.

**Before you begin**

Before you begin, coordinate with your security administrator to determine the appropriate security scheme for your DB2 UET users. Also, review the reference information on the security exit. See the *DB2 Utilities Enhancement Tool User’s Guide*.

**About this task**

The security exit must be written in assembler language. A sample exit (ABPXSE00) and corresponding DSECT (ABPAPISE) are provided in the *hlq.mlq.SABPSAMP* library, where *hlq* is the high-level qualifier and *mlq* is the
mid-level qualifier that you specified when you ran Tools Customizer.

**Procedure**

1. Copy the sample exit ABPXSE00 and the DSECT ABPAPISE to the library where you want to store your security exit.

   **Important:** Do not change the copy of the DSECT ABPAPISE. Maintain the DSECT in its original state to ensure that it properly defines the layout of the memory for the API control block.

2. Edit the copy of the exit ABPXSE00, as needed, to implement your security scheme. The sample exit includes comments to guide you through this process. Depending on your security requirements, you might need to edit the exit significantly or make only minor changes.

3. Assemble and link the exit code to create an executable exit routine.

4. Ensure that the load module for the exit is available to the started task at runtime either by including it in the APF-authorized DB2 UET load library or by putting it in its own APF-authorized load library and then including that library in the STEPLIB concatenation.

5. Specify the exit name in the SECURITY_EXIT option of the started task initialization options member.

**What to do next**

Optionally, create pre- or post-cancel user exits to perform actions either before or after a thread is canceled. See the DB2 Utilities Enhancement Tool User’s Guide.

**Creating a pre- or post-cancel exit (optional)**

If you need to perform additional processing prior to or after thread cancelations, you can create a pre-cancel exit, post-cancel exit, or both. This customization step is optional.

**Before you begin**

Before you begin, work with your production control coordinator, DB2 DBA, or other appropriate personnel at your site to determine your pre-cancel or post-cancel processing requirements. For example, you might need a pre-cancel exit to prevent the cancelation of threads that are running under a specific DB2 plan or a post-cancel exit to notify users when cancelations complete. Also, review the reference information on the pre-cancel and post-cancel exits. For more information about pre-cancel and post-cancel exits, see the DB2 Utilities Enhancement Tool User’s Guide.

**About this task**

These exits must be written in assembler language. Sample exits and corresponding DSECTs are provided in the hlq.mlq.SABPSAMP library, where hlq is the high-level qualifier and mlq is the mid-level qualifier that you specified when you ran Tools Customizer.

**Procedure**

1. Copy the sample exit and the DSECT for the pre- or post-cancel exit to the library where you want to store the exit.
   - For a pre-cancel exit, copy the sample exit ABPXPR00 and the DSECT ABPAPIPR.
• For a post-cancel exit, copy the sample exit ABPXPO00 and the DSECT ABPAPIPO.

**Important:** Do not change the copy of the DSECT. Maintain the DSECT in its original state to ensure that it properly defines the layout of the memory for the API control block.

2. Edit the copy of the sample exit, as needed, to implement your pre- or post-cancel processing requirements. The sample exit includes comments to guide you in this process. Depending on your requirements, you might need to significantly edit the exit or make only minor changes.

3. Assemble and link the exit code to create an executable exit routine.

4. Ensure that the load module for the exit is available to the started task at runtime either by including it in the APF-authorized DB2 UET load library or by putting it in its own APF-authorized load library and then including that library in the STEPLIB concatenation.

5. Specify the exit name in the PRE_CANCEL_EXIT option or POST_CANCEL_EXIT option of the started task initialization options member.

**What to do next**

Start the started task to begin using the product. See **“Starting the started task.”**

**Starting the started task**

Start the DB2 UET started task so that you can begin using the product interfaces to block and cancel threads or implement the DB2 utility enhancements. This customization step is required.

**About this task**

To start the started task, issue the following operator command from the z/OS console:

```
S abpstc
```

Where `abpstc` is the member name of the DB2 UET PROC in the system PROCLIB.

If you issue the command from SDSF instead, begin with a forward slash as follows:

```
/ S abpstc
```

The Tools Customizer generated the started task name based on the value that you specified in the Tools Customizer field **DB2 UET Configuration Name**, and then inserted that name in the started task PROC. If you changed the started task name in the PROC, make sure that you use that new name in Start command.

**What to do next**

Start the ISPF interface to view all active threads on the system, or to cancel specific threads. See the task **“Starting the ISPF interface.”**

**Starting the ISPF interface**

Start the ISPF interface so that you can use it to view or cancel DB2 threads, view the product status, or override selected started task initialization options.
About this task

If you copied the REXX EXEC for running the interface to another data set or data set member, make sure that you specify the name of that data set or member in the command statement.

The variables in the command statement are as follows:

- `hlq` is the high-level qualifier that you specified during customization.
- `mlq` is the mid-level qualifier that you specified during customization.

Procedure

1. Issue the following operator command from the z/OS console:
   ```
   TSO ex 'hlq.mlq.SABPCLST(ABPF)'
   ```
2. Press Enter.

Results

- If you are starting the interface for the first time, DB2 UET automatically displays the Set ABPID panel so that you can select the DB2 UET configuration to use. After you specify a configuration, DB2 UET automatically displays the Set DB2 System panel so that you can select the DB2 subsystem to which to connect.

- If you previously selected a product configuration and DB2 subsystem, DB2 UET displays the Main Menu first. If the selected product configuration is not running when you start the interface, the Set ABPID panel is displayed and lists any product configurations that are currently running. You can either select one of the active product configurations or ask the product administrator to start the product configuration that you usually use.
Chapter 7. Troubleshooting and messages

Use this information to diagnose and correct problems that you might experience when you customize the components of the DB2 Utilities Solution Pack.

Important: This section includes only the messages that you might encounter during the Tools Customizer customization process. It does not include messages that can be issued by a solution pack component. For the complete set of messages that are associated with any solution pack component, see the component user’s guide.

Tools Customizer troubleshooting

Use this information to diagnose and correct problems that you experience with Tools Customizer.

Gathering diagnostic information

Before you report a problem with Tools Customizer to IBM Software Support, you need to gather the appropriate diagnostic information.

Procedure

Provide the following information for all Tools Customizer problems:

- A clear description of the problem and the steps that are required to re-create the problem
- Relevant screen captures
- All messages that were issued as a result of the problem
- Product release number and the number of the last program temporary fix (PTF) that was installed
- The version of DB2 that you are using and the type and version of the operating system that you are using
- The Tools Customizer trace data set
- The Tools Customizer data store data set and the high_level_qualifier.SCCQTENU data set

Determining the trace data set name

You will need to identify the name of the trace data set if you cannot allocate the trace data set, the trace data set runs out of space, or IBM Software Support asks for it.

The name of the trace data set depends on the prefix setting in the TSO profile. To identify the name of the trace data set, you must know the prefix setting.

- If PREFIX is set, the name of the trace data set is prefix.CCQ.TRACE, where prefix is the TSO prefix that you specified in the profile.
- If NOPREFIX is set, the name of the trace data set is user_ID.CCQ.TRACE, where user_ID is your TSO user ID.
Tools Customizer messages

Use the information in these messages to help you diagnose and solve Tools Customizer problems.

CCQB0001 The component parameter data was saved in the data store.
Explanation: Changes that were made to the component parameters were saved in the data store.
System action: None.
User response: No action is required.

CCQB001I The DB2 parameter data was saved in the data store.
Explanation: Changes that were made to the DB2 parameters were saved in the data store.
System action: None.
User response: No action is required.

CCQB002I The LPAR parameter data was saved in the data store.
Explanation: Changes that were made to the LPAR parameters were saved in the data store.
System action: None.
User response: No action is required.

CCQB003E At least one step must be selected in a selected task. The selected task is task_description.
Explanation: When a task is selected, at least one step must be selected. A selected step is missing from the specified task.
System action: Processing stops.
User response: Select a step in the specified task or deselect the task.

CCQB004I The required information to run the Discover EXEC was saved in the data store.
Explanation: The data store contains all the information that is required to run the Discover EXEC.
System action: None.
User response: No action is required.

CCQB005E The conflicting values for the parameter_name parameter must be resolved before the information can be saved.
Explanation: Two values for one parameter conflict with each other, and they must be resolved to save the information.
System action: Processing stops.
User response: Resolve the conflicting values for the parameter.

CCQB006E One row must be selected.
Explanation: One row in the table must be selected.
System action: Processing stops.
User response: Select one row.

CCQB007E Only one row can be selected.
Explanation: Multiple rows in the table are selected, but only one row is allowed to be selected.
System action: Processing stops.
User response: Select only one row.

CCQC000I The jobs have been customized on the selected DB2 entries.
Explanation: The jobs were customized on the DB2 entries that were selected.
System action: None.
User response: Press Enter to clear the message.

CCQC001W The jobs were not generated on one or more of the selected DB2 entries. Press PF3 to check the DB2 entries that were not customized.
Explanation: The component was not customized on one or more of the DB2 entries that were selected.
System action: None.
User response: Press PF3 to see the DB2 entries on which the component was not customized. The status of these DB2 entries is Errors in Customization.

CCQC002I The edit session was started automatically because values for required parameters are missing or must be verified.
Explanation: If component, LPAR parameters, or DB2 parameters are not defined or if parameter definitions must be verified, an editing session for the undefined or unverified parameters starts automatically.
System action: None.
User response: Define values for all required component, LPAR parameters, or DB2 parameters.

CCQC003W The template_name template in the library_name metadata library does not contain any parameters.

Explanation: The specified template does not have parameters.

System action: None.

User response: No action is required.

CCQC004S The value of the "type" attribute for the template_name template in the library_name metadata library does not match the value that was previously specified. The value is value_name, and the previously specified value is value_name.

Explanation: The value of the "type" attribute must match the value that was previously specified.

System action: Processing stops.

CCQC005S The template_name template exceeds the number of allowed templates for a customization sequence. The template is in the library_name metadata library.

Explanation: The customization sequence can process only number templates. The specified template cannot be processed because the customization sequence already contains the maximum number of templates.

System action: Processing stops.

CCQC006E The jobs could not be generated for the group_attach_name DB2 group attach name.

Explanation: The customization jobs could not be generated for the specified DB2 group attach name.

System action: Processing stops.

CCQC007E The jobs could not be generated for the subsystem_id DB2 subsystem.

Explanation: The customization jobs could not be generated for the specified DB2 subsystem.

System action: Processing stops.

CCQC008E The jobs could not be generated for the member_name DB2 member.

Explanation: The customization jobs could not be generated for the specified DB2 member.

System action: Processing stops.

CCQC009S The jobs were not generated for the DB2 entries.

Explanation: One or more errors occurred while customization jobs were being generated for the selected DB2 entries.

System action: Processing stops.

CCQC010S The template_name template could not be accessed in the library_name metadata library.

Explanation: The specified template could not be accessed because the user does not have RACF access to the data set, the data set has incorrect data characteristics, or the data set is not cataloged.

System action: Processing stops.

User response: Ensure that you have RACF access to the data set, that the characteristics are correct according to the specifications of the component that you are customizing, and that the data set is cataloged. If the problem persists, contact IBM Software Support.

CCQC011S The template_name template could not be written to the library_name customization library.

Explanation: The specified template could not be accessed because the user does not have RACF access to the data set, the data set has incorrect data characteristics, or the data set is not cataloged.

System action: Processing stops.

User response: Ensure that you have RACF access to the data set, that the characteristics are correct according to the specifications of the component that you are customizing, and that the data set is cataloged. If the problem persists, contact IBM Software Support.

CCQC012W The job card was generated with default values because the JOB keyword was missing.

Explanation: Default values were used to generate the job card because the JOB keyword was not specified in the first line of the job card.

System action: The job card was generated with default values.

User response: No action is required. To generate the job card with your own values, add the JOB keyword in the first line of the job card.

CCQC013W The job card was generated with the default value for the programmer name because the specified programmer name exceeded 20 characters.

Explanation: Default values were used to generate the job card because the specified programmer name contained too many characters.

System action: The job card was generated with default values.

User response: No action is required. To generate the job card with your own values, add a valid programmer name in the job card. A valid programmer name is 1-20 characters.

CCQC014W The job card was generated with default values because the JOB keyword was not followed by a space.

Explanation: Default values were used to generate the job card because a space did not follow the JOB keyword.

System action: The job card was generated with default values.

User response: No action is required. To generate the job card with your own values, add a space after the JOB keyword in the job card.

CCQC015S The template_name template in the library_name metadata library contains the following file-tailoring control statement: statement_name. This control statement is not valid in a template_type template.

Explanation: The template_type template cannot contain the specified type of file-tailoring control statement.

System action: Processing stops.

CCQC016S The )DOT file-tailoring control statement exceeded the number of allowed occurrences for the template_name template in the library_name metadata library.

Explanation: The )DOT file-tailoring control statement can occur only a limited number of times in the specified template.

System action: Processing stops.

CCQC017S The nested )DOT file-tailoring control statements exceeded the number of allowed occurrences in the template_name template in the library_name metadata library.

Explanation: Nested )DOT file-tailoring control statements can occur only number times.

System action: Processing stops.

CCQC018S The template_name template in the library_name metadata library is not valid because it does not contain any data.

Explanation: The specified template is missing required data.

System action: Processing stops.

CCQC019S The template_name template in the library_name metadata library is not valid because an )ENDDOT file-tailoring control statement is missing.

Explanation: A )ENDDOT file-tailoring control statement is required in the specified template.

System action: Processing stops.

CCQC021S The template_name template in the library_name metadata library is not valid because the template must start with the parameter_name job card parameter.

Explanation: The specified template must start with the specified job card parameter.

System action: Processing stops.

CCQC022S The parameters used in a )DOT file-tailoring control statement exceeded the number of allowed parameters in the template_name template. The template is in the library_name metadata library.

The error occurs in )DOT section section_number.

Explanation: A )DOT file-tailoring control statement can contain only a limited number of parameters.

System action: Processing stops.

CCQC023S The )DOT file-tailoring control statement must include the table-name table name in the template_name template. The template is in the library_name metadata library.

The error occurs in )DOT section section_number.

Explanation: The )DOT file-tailoring control statement is missing a required table name.

System action: Processing stops.

CCQC024S ISPF file tailoring failed for the template_name template in the library_name metadata library.

Explanation: An error occurred during ISPF file tailoring for the specified template.

System action: Processing stops.

User response: Review the Tools Customizer-generated trace data set and the ISPF file tailoring trace data set. To create an ISPF file tailoring trace data set, complete the following steps:
1. Run Tools Customizer until the error is about to occur.
2. Specify the ISPFTTRC command, and press Enter.

CCQC025I Customized jobs do not exist because they have not been generated.

Explanation: The list of customized jobs cannot be displayed because the component has not been customized for any DB2 entries.

System action: None.

User response: Complete the steps to customize a component. Customized jobs are generated when all required component, LPAR parameters, and DB2 parameters are defined and at least one DB2 entry on which to customize the component has been selected.

CCQC026S The value of the "customized" attribute for the parameter_name parameter in the library_name metadata library template does not match the value that was previously specified. The value is value_name, and the previously specified value is value_name.

Explanation: The value for the "customized" attribute for a parameter must match the value that was previously specified.

System action: Processing stops.

CCQC027S The job_name customization job was not found in the library_name customization library.

Explanation: The selected customization job does not exist in the customization library.

System action: Processing stops.

CCQD001S • CCQD009S

CCQD001S  The member_name environment index member is not valid. The PL/I XML parser issued the following exception error code: code_number.

Explanation:  While determining if the specified environment index member is valid, the PL/I XML parser issued an exception error code.

System action:  Processing continues.

User response:  See the Enterprise PL/I for z/OS Programming Guide for more information about the warning.

CCQD002S  The XML structure of the member_name environment index member is not valid. The element_name element is unknown.

Explanation:  The specified environment index member contains an unknown element.

System action:  Processing stops.

User response:  See the Enterprise PL/I for z/OS Programming Guide for more information about the error.

CCQD003S  The XML structure of the member_name environment index member is not valid. Content is not allowed for the element_name element, but content was found.

Explanation:  Content was found in an element that cannot contain content.

System action:  Processing stops.

CCQD004S  The XML structure of the member_name environment index member is not valid. Content is required for the element_name element, but content was not found.

Explanation:  The specified element does not contain required content.

System action:  Processing stops.

CCQD005S  The XML structure of the member_name environment index member is not valid. The content length for the element_name element exceeds maximum_number characters.

Explanation:  The specified element contains too many characters.

System action:  Processing stops.

CCQD006S  The XML structure of the member_name environment index member is not valid. The element_name element cannot occur more than maximum_number times.

Explanation:  The specified element occurs too many times in the environment index member.

System action:  Processing stops.

CCQD007S  The XML structure of the member_name environment index member is not valid. The element_name element must occur at least minimum_number times.

Explanation:  The specified element does not occur enough times in the environment index member.

System action:  Processing stops.

CCQD008S  The XML structure of the member_name environment index member is not valid. The attribute_name attribute in the element_name element cannot occur more than maximum_number times.

Explanation:  The specified attribute occurs too many times in the environment index member.

System action:  Processing stops.

CCQD009S  The XML structure of the member_name environment index member is not valid. The attribute_name attribute in the element_name element must occur at least minimum_number times.
**CCQD010S** The XML structure of the member_name environment index member is not valid. Content is not allowed for the attribute_name attribute in the element_name element, but content was found.

**Explanation:** Content was found in an attribute that cannot contain content. The name of the attribute and the name of the element that contains it are indicated in the message text.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 215. Contact IBM Software Support.

**CCQD011S** The XML structure of the member_name environment index member is not valid. Content is required for the attribute_name attribute in the element_name element, but content was not found.

**Explanation:** An attribute does not contain required content. The name of the attribute and the name of the element that contains it are indicated in the message text.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 215. Contact IBM Software Support.

**CCQD012S** The XML structure of the member_name environment index member is not valid. The content length for the element_name element exceeds maximum_number characters.

**Explanation:** An element contains too many characters. The name of the element and the maximum number of allowed characters are indicated in the message text.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 215. Contact IBM Software Support.

**CCQD013S** The XML structure of the member_name environment index member is not valid. The attribute_name attribute in the element_name element is unknown.

**Explanation:** The environment index member contains an unknown attribute. The name of the unknown attribute and the name of the element that contains it are indicated in the message text.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 215. Contact IBM Software Support.

**CCQD050S** The following LPAR serial number is duplicated in the environment index member: serial_number.

**Explanation:** The environment index member contains duplicate LPAR serial numbers. The duplicate serial number is indicated in the message text.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 215. Contact IBM Software Support.

**CCQD051S** The following DB2 serial number is duplicated in the environment index member: serial_number.

**Explanation:** The environment index member contains duplicate DB2 serial numbers. The duplicate serial number is indicated in the message text.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 215. Contact IBM Software Support.

**CCQD052S** The following DB2 group attach name is duplicated in the environment index member: group_attach_name.

**Explanation:** The environment index member contains duplicate group attach names.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 215. Contact IBM Software Support.

**CCQD053S** The reference to the following DB2 subsystem for a DB2 group attach name is duplicated in the environment index member: subsystem_ID.

**Explanation:** The environment index member contains
duplicate references to a DB2 subsystem for a DB2 group attach name.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 215. Contact IBM Software Support.

**CCQD054S** The reference to the following DB2 subsystem for the LPAR name LPAR is duplicated in the environment index member: subsystem_ID.

**Explanation:** The environment index member contains duplicate references to a DB2 subsystem for an LPAR. The duplicate subsystem ID is indicated in the message text.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 215. Contact IBM Software Support.

**CCQD055S** The following DB2 group attach name was not found in the environment index member: group_attach_name.

**Explanation:** A group attach name that is referenced by a DB2 member does not exist in the environment index member.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 215. Contact IBM Software Support.

**CCQD056S** The following LPAR was not found in the environment index member: LPAR_name.

**Explanation:** The LPAR does not exist in the environment index member.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 215. Contact IBM Software Support.

**CCQD057S** The following LPAR is duplicated in the environment index member: LPAR_name.

**Explanation:** The environment index member contains duplicate LPARs. The name of the duplicate LPAR name is indicated in the message text.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 215. Contact IBM Software Support.

**CCQD100W** The member_name component index member is not valid. The PL/I XML parser issued the following exception warning code: code_number.

**Explanation:** While determining if the component index member is valid, the PL/I XML parser issued the specified exception warning code.

**System action:** Processing continues.

**User response:** See the Enterprise PL/I for z/OS Programming Guide for more information about the specified exception warning code.

**CCQD101S** The member_name component index member is not valid. The PL/I XML parser issued the following exception error code: code_number.

**Explanation:** While determining if the component index member is valid, the PL/I XML parser issued the specified exception error code. Ensure that the Tools Customizer data store data set DDB is the same as the sample SQQSAMP(CCCQCDATS) data set DDB.

**System action:** Processing stops.

**User response:** See the Enterprise PL/I for z/OS Programming Guide for more information about the specified exception error code. Ensure that the Tools Customizer data store data set DCB is the same as the sample SQQSAMP(CCCQCDATS) data set DCB.

**CCQD102S** The XML structure of the member_name component index member is not valid. The element_name element is unknown.

**Explanation:** The specified component index member contains an unknown element.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 215. Contact IBM Software Support.

**CCQD103S** The XML structure of the member_name component index member is not valid. Content is not allowed for the element_name element, but content was found.

**Explanation:** Content was found for an element that cannot contain content.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 215. Contact IBM Software Support.
CCQD104S  The XML structure of the member_name component index member is not valid. Content is required for the element_name element, but content was not found.

Explanation: The specified element does not contain required content.

System action: Processing stops.

CCQD105S  The XML structure of the member_name component index member is not valid. The content length for the element_name element exceeds maximum_number characters.

Explanation: The specified element contains too many characters.

System action: Processing stops.

CCQD106S  The XML structure of the member_name component index member is not valid. The element_name element cannot occur more than maximum_number times.

Explanation: The specified element occurs too many times in the component index member.

System action: Processing stops.

CCQD107S  The XML structure of the member_name component index member is not valid. The element_name element must occur at least minimum_number times.

Explanation: The specified element does not occur enough times in the component index member.

System action: Processing stops.

CCQD108S  The XML structure of the member_name component index member is not valid. The attribute_name attribute in the element_name element cannot occur more than maximum_number times.

Explanation: An attribute occurs too many times. The name of the attribute and the element that contains it are indicated in the message text.

System action: Processing stops.

CCQD109S  The XML structure of the member_name component index member is not valid. The attribute_name attribute in the element_name element must occur at least minimum_number times.

Explanation: The specified attribute does not occur enough times in the component index member.

System action: Processing stops.

CCQD110S  The XML structure of the member_name component index member is not valid. Content is not allowed for the attribute_name attribute in the element_name element, but content was found.

Explanation: An attribute cannot contain content. The name of the attribute and the element that contains it are indicated in the message text.

System action: Processing stops.

CCQD111S  The XML structure of the member_name component index member is not valid. Content is required for the attribute_name attribute in the element_name element, but content was not found.

Explanation: An attribute requires content. The name of the attribute and the name of the element that contains it are indicated in the message text.

System action: Processing stops.

CCQD112S  The XML structure of the member_name component index member is not valid. The content length for the element_name element exceeds maximum_number characters.

Explanation: The specified element contains too many characters.

System action: Processing stops.

CCQD113S  The XML structure of the member_name component index member is not valid.
The attribute_name attribute in the element_name element is unknown.

Explanation: The specified attribute in the component index member is unknown.
System action: Processing stops.

CCQD118S  The content of the member_name component index member is not valid.
The configuration_ID configuration ID for the configuration-name configuration name is not unique.

Explanation: The specified pack ID could not be found in the metadata library.
System action: Processing stops.

CCQD120S  The content of the member_name product index member is not valid. The pack ID pack_ID that is referenced by product prefix product_prefix in the metadata library library_name could not be found.

Explanation: The specified pack ID could not be found in the metadata library.
System action: Processing stops.

CCQD121I  The specified pack contains the component_name, which was previously specified as a stand-alone product.

Explanation: The specified component of the pack was previously specified as a stand-alone product.
System action: None.
User response: No action is required.

CCQD122I  The specified component metadata library was previously specified as part of the pack_name.

Explanation: The specified metadata library for the component was previously specified as part of a pack.
System action: None.
User response: No action is required.

CCQD123E  The customization library name library_name is being used by another product or component. Specify another customization library qualifier on the Tools Customizer Settings panel.

Explanation: A different product or component is using the specified customization library.
System action: None.
User response: Specify another customization library qualifier on the Tools Customizer Settings panel.

CCQD300W  The member_name component environment member is not valid. The PL/I XML parser issued the following exception warning code: code_number.

Explanation: While determining if the component environment member is valid, the PL/I XML parser issued the specified exception warning code.
System action: Processing continues.
User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the specified exception warning code.

CCQD301S  The member_name component environment member is not valid. The PL/I XML parser issued the following exception error code: code_number.

Explanation: While determining if the component environment member is valid, the PL/I XML parser issued the specified exception error code.
System action: Processing stops.
User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the specified exception error code.

CCQD302S  The XML structure of the member_name component environment member is not valid. The element_name element is unknown.

Explanation: The specified component environment member contains an unknown element.
System action: Processing stops.

CCQD311S  The XML structure of the member_name component environment member is not valid. Content is required for the attribute_name attribute in the element_name element, but content was not found.

Explanation: The specified attribute requires content. The name of the attribute and the name of the element that contains it are indicated in the message text.

System action: Processing stops.

CCQD312S  The XML structure of the member_name component environment member is not valid. The content length for the element_name element exceeds maximum_number characters.

Explanation: The specified element contains too many characters.

System action: Processing stops.

CCQD313S  The XML structure of the member_name component environment member is not valid. The attribute_name attribute in the element_name element is unknown.

Explanation: The specified attribute in the component environment member is unknown.

System action: Processing stops.

CCQD311S  CCQD355E

CCQD350I  The subsystem_ID DB2 subsystem is associated with this component.

Explanation: The specified DB2 subsystem was added and saved in the Tools Customizer data store for the component to be customized.

System action: Processing continues.

User response: No action is required.

CCQD351I  The member_name DB2 member for the group_attach_name DB2 group attach name is associated with this component.

Explanation: The specified DB2 member for the group attach name was added and saved in the Tools Customizer data store for the component to be customized.

System action: Processing continues.

User response: No action is required.

CCQD352I  The group_attach_name DB2 group attach name is associated with this component.

Explanation: The specified DB2 group attach name was added and saved in the Tools Customizer data store for the component to be customized.

System action: Processing continues.

User response: No action is required.

CCQD353E  The subsystem_ID DB2 subsystem is already associated with this component.

Explanation: The specified DB2 subsystem cannot be added for the component to be customized because it already exists in the component environment in the data store.

System action: None.

User response: Ensure that the DB2 subsystem is specified correctly. If the problem persists, contact IBM Software Support.

CCQD354E  The member_name DB2 member for the group_attach_name DB2 group attach name is already associated with this component.

Explanation: The specified DB2 member for the group attach name cannot be added for the component to be customized because it already exists in the component environment in the data store.

System action: None.

User response: Ensure that the DB2 group attach name is specified correctly. If the problem persists, contact IBM Software Support.

CCQD355E  The group_attach_name DB2 group attach name is already associated with this component.

Explanation: The specified DB2 group attach name cannot be added for the component to be customized because it already exists in the component environment in the data store.

System action: Processing stops.

User response: Ensure that the DB2 group attach name is specified correctly. If the problem persists, contact IBM Software Support.
CCQD356S  The library_name metadata library is already associated with the maximum number of allowed DB2 entries for this component.

Explanation: The specified metadata library cannot be associated with more DB2 entries because it is already associated with the number of DB2 entries that are allowed.

System action: Processing stops.

User response: Delete an associated DB2 entry, and associate the specified library with another DB2 entry again.

CCQD357I  The subsystem_ID DB2 subsystem is unassociated with this component.

Explanation: The specified DB2 SSID was unassociated with the component that you are customizing.

System action: Processing continues.

User response: No action is required.

CCQD358I  The member_name DB2 member for the group_attach_name DB2 group attach name is unassociated with this component.

Explanation: The specified DB2 member for the DB2 group attach name was unassociated with the component that you are customizing.

System action: Processing continues.

User response: No action is required.

CCQD359I  The group_attach_name DB2 group attach name is unassociated with this component.

Explanation: The specified DB2 group attach name was unassociated with the component that you are customizing.

System action: Processing continues.

User response: No action is required.

CCQD360S  The library_name metadata library is not associated with the specified DB2 subsystem subsystem_ID.

Explanation: The specified DB2 subsystem and metadata library are not associated with each other.

System action: None.

User response: Ensure that the DB2 subsystem and the metadata library are associated. If the problem persists, contact IBM Software Support.

CCQD361S  The library_name metadata library is not associated with the specified DB2 data sharing group member member_name for the group_attach_name DB2 group attach name.

Explanation: The specified DB2 data sharing group member for the group attach name and metadata library are not associated with each other.

System action: None.

User response: Ensure that the DB2 data sharing group member for the group attach name and the metadata library are associated. If the problem persists, contact IBM Software Support.

CCQD362S  The library_name metadata library is not associated with the specified group_attach_name DB2 group attach name.

Explanation: The specified DB2 group attach name and metadata library are not associated with each other.

System action: None.

User response: Ensure that the DB2 group attach name and the metadata library are associated. If the problem persists, contact IBM Software Support.

CCQD400W  The customization parser issued the code_number warning code while it parsed the component customization member member_name. See the PL/I programming guide for more information about this XML parser continuable exception code.

Explanation: While determining if the specified member is valid, the PL/I XML parser issued an exception warning code.

System action: Processing continues.

User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the warning.

CCQD401S  The customization parser issued the code_number error code while it parsed the component customization member member_name. See the PL/I programming guide for more information about this XML parser terminating exception code.

Explanation: While determining if the specified member is valid, the PL/I XML parser issued an exception error code.

System action: Processing stops.

User response: See the Enterprise PL/I for z/OS
Programming Guide for more information about the error.

CCQD500W  The data_set_name data store data set was not found.
Explanation: Tools Customizer could not find the specified data store data set.
System action: None.
User response: No action is required.

CCQD501W  The data_set_name data store data set was not found, so it was created.
Explanation: Tools Customizer created the specified data set because it could not be found.
System action: None.
User response: No action is required.

CCQD502E  The data_set_name data store data set is not writable.
Explanation: Tools Customizer cannot write to the specified data set.
System action: None.
User response: Ensure that the data set is writable.

CCQD503E  The data_set_name data store data set could not be opened with the disposition_type disposition.
Explanation: Tools Customizer could not open the data set with the specified disposition.
System action: Processing stops.
User response: Ensure that you have WRITE authority access to this data set.

CCQD504E  The data_set_name data store data set could not be opened with the option_name option.
Explanation: Tools Customizer could not open the data set with the specified option.
System action: Processing stops.
User response: Ensure that you have WRITE authority access to this data set.

CCQD505E  The data_set_name data store data set could not be created.
Explanation: Tools Customizer could not create the specified data set.
System action: Processing stops.
User response: Ensure that you have the authority to create data sets and that the DASD is not full.

CCQD510I  The DB2 SSID and DB2 group attach name were created.
Explanation: The DB2 SSID and DB2 group attach name were created and saved in the data store.
System action: None.
User response: No action is required.

CCQD511E  The DB2 entry already exists in the list of DB2 entries to be associated.
Explanation: The DB2 entry cannot be added because it already exists in the list of DB2 entries to be associated.
System action: None.
User response: Specify a different DB2 entry.

CCQD512S  An error occurred while a DB2 entry was being created.
Explanation: A severe error occurred while a DB2 entry was being created.
System action: Processing stops.

CCQD513E  The specified DB2 entry already exists and is associated with the current component on the Customizer Workplace panel.
Explanation: The DB2 entry cannot be added because it already exists, and it is already associated with the component to be customized.
System action: None.
User response: Press F3 to go to the Customizer Workplace panel to see the DB2 entry, or specify a different DB2 entry.

CCQD514E  A value is required for a DB2 subsystem, a DB2 group attach name, or both before they can be created.
Explanation: Required information is missing. A DB2 subsystem, a DB2 group attach name, or both must be specified.
System action: None.
User response: Specify a DB2 subsystem, a DB2 group attach name, or both.
CCQD515E  The specified DB2 entry already exists in the list of DB2 entries and is already associated with the current component.

Explanation: The DB2 entry has already been created and associated with the component that you want to customize.

System action: None.

User response: Specify a different DB2 entry.

CCQD516E  The specified DB2 entry already exists in the list of DB2 entries on the Associate DB2 Entry with Component panel but is not associated with the current component.

Explanation: The DB2 entry exists, but it must be associated with the component to be customized.

System action: None.

User response: On the Customizer Workplace panel, issue the ASSOCIATE command to associate the DB2 entry with the component.

CCQD517S  An error occurred while a DB2 entry was being copied.

Explanation: A severe error occurred while a DB2 entry was being copied.

System action: Processing stops.

CCQD518E  A value is required for a DB2 subsystem, a DB2 group attach name, or both before they can be copied.

Explanation: Required information is missing. A DB2 subsystem, a DB2 group attach name, or both must be specified.

System action: None.

User response: Specify a DB2 subsystem, a DB2 group attach name, or both.

CCQD519I  The DB2 entry was copied.

Explanation: The DB2 entry was copied and saved in the Tools Customizer data store.

System action: None.

User response: No action is required.

CCQD520S  The DB2 entry was copied to the list of DB2 entries but was not associated because the component is already associated with the allowed number of DB2 entries.

Explanation: The DB2 entry was not completely copied because a component can be associated with only 1200 DB2 entries.

System action: Processing stops.

User response: Remove a DB2 entry from the list, and copy the specified DB2 entry again.

CCQD521E  Line_command is not a valid line command.

Explanation: The specified line command is not valid. Valid line commands are on the panel.

System action: Processing stops.

User response: Specify a valid line command.

CCQD522E  The subsystem_ID DB2 subsystem ID occurs more than once in the list. Each row must be unique.

Explanation: The specified DB2 subsystem ID can be used only once.

System action: Processing stops.

User response: Specify a different DB2 subsystem ID.

CCQD523E  The group_attach_name DB2 group attach name occurs more than once in the list. Each row must be unique.

Explanation: The specified DB2 group attach name can be used only once.

System action: Processing stops.

User response: Specify a different DB2 group attach name.

CCQD524E  The member_name DB2 member for the DB2 group attach name occurs more than once in the list. Each row must be unique.

Explanation: The specified DB2 member for the DB2 group attach name can be used only once.

System action: Processing stops.

User response: Specify a different DB2 member for the DB2 group attach name.

CCQD567E  CCQD582S

User response: Specify a different DB2 member.

CCQD567E The group_attach_name DB2 group attach name already exists in the list of DB2 entries and is already associated with the current component.

Explanation: The specified DB2 group attach name is already associated.

System action: None.

User response: Specify another DB2 group attach name.

CCQD568I To customize product_name, at least one DB2 entry must be associated with this product.

Explanation: The specified product requires at least one associated DB2 entry.

System action: None.

User response: To continue the customization process for the specified product, associate one or more DB2 entries with it.

CCQD569I To customize the product_name product configuration, at least one DB2 entry must be associated with this configuration.

Explanation: The configuration for the specified product requires at least one associated DB2 entry.

System action: None.

User response: To continue the customization process for the configuration of the specified product, associate one or more DB2 entries with the configuration.

CCQD577W The mode_name DB2 mode of the subsystem_ID DB2 subsystem is not supported by the product.

Explanation: The product does not support the specified DB2 mode.

System action: None.

User response: Specify a supported DB2 mode.

CCQD578W The mode_name DB2 mode of the member_name DB2 member for the DB2 group is not supported by the product.

Explanation: The product does not support the specified DB2 mode.

System action: None.

User response: Specify a supported DB2 mode.

CCQD579W The mode_name DB2 mode of the group_attach_name DB2 group attach name is not supported by the product.

Explanation: The product does not support the specified DB2 mode.

System action: None.

User response: Specify a supported DB2 mode.

CCQD580S The subsystem_ID DB2 subsystem was copied to the list of DB2 entries but was not associated because the component is already associated with the allowed number of DB2 entries.

Explanation: The copied DB2 subsystem was not associated with the component because the component is associated with the maximum number of DB2 entries.

System action: None.

User response: Remove an associated DB2 entry and associate the component with the copied DB2 subsystem.

CCQD581S The member_name DB2 member for the group_attach_name DB2 group attach name was copied to the list of DB2 entries but was not associated because the component is already associated with the allowed number of DB2 entries.

Explanation: The copied DB2 member for the DB2 group attach name was not associated with the component because the component is associated with the maximum number of DB2 entries.

System action: None.

User response: Remove an associated DB2 entry and associate the component with the copied DB2 member.

CCQD582S The group_attach_name DB2 group attach name was copied to the list of DB2 entries but was not associated because the component is already associated with the allowed number of DB2 entries.

Explanation: The copied DB2 group attach name was not associated with the component because the component is associated with the maximum number of DB2 entries.

System action: None.

User response: Remove an associated DB2 entry and associate the component with the copied DB2 group attach name.
CCQD584I  The member_name DB2 member for the group_attach_name DB2 group attach name is copied to the subsystem_ID DB2 subsystem.

Explanation: The specified DB2 member was copied.
System action: None.
User response: No action is required.

CCQD585I  The group_attach_name DB2 group attach name cannot be copied because a DB2 member is required.

Explanation: The specified DB2 group attach name was not copied because a DB2 member was missing.
System action: None.
User response: No action is required.

CCQD586S  The current LPAR is LPAR_name, but the data store contains information about the LPAR_name LPAR. You must use the LPAR_name LPAR to customize the component.

Explanation: The LPAR that is stored in the data store data set must be used to customize the component.
System action: Processing stops.
User response: Use the LPAR that is stored in the data store data set.

CCQD587W  The level_number DB2 level of the subsystem_name DB2 subsystem is not supported by the product.

Explanation: The product does not support the specified DB2 level.
System action: Processing continues.
User response: Specify a supported level of DB2.

CCQD588W  The level_number DB2 level of the member_name DB2 member of the group_name DB2 group is not supported by the product.

Explanation: The product does not support the specified DB2 level.
System action: Processing continues.
User response: Specify a supported level of DB2.

CCQD589W  The level_number DB2 level of the group_name DB2 group attach name is not supported by the product.

Explanation: The product does not support the specified DB2 level.

System action: Processing continues.
User response: Specify a supported level of DB2.

CCQD590E  The subsystem_ID DB2 subsystem was not deleted.

Explanation: An internal error occurred while the specified DB2 subsystem was being deleted.
System action: Processing stops.

CCQD591E  The member_name DB2 member for the group_attach_name DB2 group attach name was not deleted.

Explanation: An internal error occurred while the specified DB2 member was being deleted.
System action: Processing stops.

CCQD592E  The group_attach_name DB2 group attach name was not deleted.

Explanation: An internal error occurred while the specified DB2 group attach name was being deleted.
System action: Processing stops.

CCQD593I  The subsystem_ID DB2 subsystem was deleted.

User response: No action is required.

CCQD594I  The member_name DB2 for the group_attach_name DB2 group attach name was deleted.

User response: No action is required.

CCQD595I  The group_attach_name DB2 group attach name was deleted.

User response: No action is required.

CCQD596E  The subsystem_ID DB2 subsystem was not deleted.

Explanation: An internal error occurred while the specified DB2 subsystem was being deleted.
System action: Processing stops.

CCQD597E  The member_name DB2 member for the group_attach_name DB2 group attach name was not deleted.

Explanation: An internal error occurred while the specified DB2 member was being deleted.
System action: Processing stops.

CCQD598E  The group_attach_name DB2 group attach name was not deleted.

Explanation: An internal error occurred while the specified DB2 group attach name was being deleted.
System action: Processing stops.

CCQD600W  The member_name component customization member is not valid. The PL/I XML parser issued the following exception warning code: code_number.

Explanation: While determining if the XML structure of the component customization member is valid, the
CCQD601S • CCQD608S

PL/I XML parser issued an exception warning code.

System action: Processing continues.

User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the exception warning code.

CCQD601S The member_name component customization member is not valid. The PL/I XML parser issued the following exception error code: code_number.

Explanation: While determining if the XML structure of the component customization member is valid, the PL/I XML parser issued an exception error code.

System action: Processing stops.

User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the exception error code.

CCQD602S The XML structure of the member_name component customization member is not valid. The element_name element is unknown.

Explanation: The data store member contains an unknown element.

System action: Processing stops.

User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the exception error code.

CCQD603S The XML structure of the member_name component customization member is not valid. Content is not allowed for the element_name element, but content was found.

Explanation: The specified element cannot contain content.

System action: Processing stops.

User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the exception error code.

CCQD604S The XML structure of the member_name component customization member is not valid. Content is required for the element_name element, but content was not found.

Explanation: The specified element is missing required content.

System action: Processing stops.

User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the exception error code.

CCQD605S The XML structure of the member_name component customization member is not valid. The content length for the element_name element exceeds maximum_number characters.

Explanation: The specified element contains too many characters.

System action: Processing stops.

User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the exception error code.

CCQD606S The XML structure of the member_name component customization member is not valid. The element_name element cannot occur more than maximum_number times.

Explanation: The specified element occurs too many times.

System action: Processing stops.

User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the exception error code.

CCQD607S The XML structure of the member_name component customization member is not valid. The element_name element must occur at least minimum_number times.

Explanation: The specified element does not occur enough times.

System action: Processing stops.

User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the exception error code.

CCQD608S The XML structure of the member_name component customization member is not valid. The attribute_name attribute in the element_name element cannot occur more than maximum_number times.

Explanation: The specified attribute occurs too many times.

System action: Processing stops.

User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the exception error code.
CCQD609S  The XML structure of the component customization member is not valid. The attribute attribute in the element element must occur at least minimum_number times.

Explanation:  The specified attribute does not occur enough times.

System action:  Processing stops.

CCQD610S  The XML structure of the component customization member is not valid. Content is not allowed for the attribute attribute in the element element, but content was found.

Explanation:  The specified attribute cannot contain content.

System action:  Processing stops.

CCQD611S  The XML structure of the component customization member is not valid. Content is required for the attribute attribute in the element element, but content was not found.

Explanation:  The specified attribute does not contain required content.

System action:  Processing stops.

CCQD612S  The XML structure of the component customization member is not valid. The content length for the element element exceeds maximum_number characters.

Explanation:  The specified element contains too many characters.

System action:  Processing stops.

CCQD613S  The XML structure of the component customization member is not valid. The attribute attribute in the element element is unknown.

Explanation:  The specified attribute in the data store member is unknown.

System action:  Processing stops.

CCQD700W  The DB2 data member is not valid. The PL/I XML parser issued the following exception warning code: code_number.

Explanation:  While determining if the XML structure of the DB2 data member is valid, the PL/I XML parser issued an exception warning code.

System action:  Processing continues.

User response:  See the Enterprise PL/I for z/OS Programming Guide for more information about the exception warning code.

CCQD701S  The DB2 data member is not valid. The PL/I XML parser issued the following exception error code: code_number.

Explanation:  While determining if the XML structure of the DB2 data member is valid, the PL/I XML parser issued an exception error code.

System action:  Processing continues.

User response:  See the Enterprise PL/I for z/OS Programming Guide for more information about the exception error code.

CCQD750W  The value value in the parameter parameter_name was skipped because only maximum_number values are allowed.

Explanation:  The specified value was skipped because
it exceeds the number of allowed values in the DB2 parameter.

**System action:** Processing continues.

**User response:** No action is required. To stop this message from being issued, remove the extra values from the DB2 parameter.

**CCQD800W** The member_name LPAR data member is not valid. The PL/I XML parser issued the following exception warning code: code_number.

**Explanation:** While determining if the XML structure of the LPAR data member is valid, the PL/I XML parser issued an exception warning code.

**System action:** Processing continues.

**User response:** See the Enterprise PL/I for z/OS Programming Guide for more information about the exception warning code.

**CCQD801S** The member_name LPAR data member is not valid. The PL/I XML parser issued the following exception error code: code_number.

**Explanation:** While determining if the XML structure of the LPAR data member is valid, the PL/I XML parser issued an exception error code.

**System action:** Processing continues.

**User response:** See the Enterprise PL/I for z/OS Programming Guide for more information about the exception error code.

**CCQD850W** The value_number value in the LPAR parameter parameter_name was skipped because only maximum_number values are allowed.

**Explanation:** The specified value was skipped because it exceeds the number of allowed values in the LPAR parameter.

**System action:** Processing continues.

**User response:** No action is required. To stop this message from being issued, remove the extra values from the LPAR parameter.

**CCQD851I** The subsystem_ID DB2 subsystem is copied to the member_name DB2 member for the group_attach_name DB2 group attach name.

**User response:** No action is required.

**CCQD852I** The member_name DB2 member for the group_attach_name DB2 group attach name is copied to the member_name DB2 member for the group_attach_name DB2 group attach name.

**User response:** No action is required.

**CCQD854I** The member_name DB2 member for the group_attach_name DB2 group ’attach name is copied to multiple DB2 entries.

**User response:** No action is required.

**CCQD900W** The member_name component data member is not valid. The PL/I XML parser issued the following exception warning code: code_number.

**Explanation:** While determining if the XML structure of the component data member is valid, the PL/I XML parser issued an exception warning code.

**System action:** Processing continues.

**User response:** See the Enterprise PL/I for z/OS Programming Guide for more information about the exception warning code.

**CCQD901S** The member_name component data member is not valid. The PL/I XML parser issued the following exception error code: code_number.

**Explanation:** While determining if the XML structure of the component data member is valid, the PL/I XML parser issued an exception error code.

**System action:** Processing continues.

**User response:** See the Enterprise PL/I for z/OS Programming Guide for more information about the exception error code.

**CCQD950W** The value_number value in the component parameter parameter_name was skipped because only maximum_number values are allowed.

**Explanation:** The specified value was skipped because it exceeds the number of allowed values in the component parameter.

**System action:** Processing continues.

**User response:** No action is required. To stop this message from being issued, remove the extra values from the component parameter.
CCQD960I  The subsystem_ID DB2 subsystem was changed to the member_name DB2 member for the group_attach_name DB2 group attach name.

User response:  No action is required.

CCQD961I  The member_name DB2 member for the group_attach_name DB2 group attach name was changed to the subsystem_ID DB2 subsystem.

User response:  No action is required.

CCQD962I  The member_name DB2 member for the group_attach_name DB2 group attach name was changed to the member_name DB2 member for the group_attach_name DB2 group attach name.

User response:  No action is required.

CCQD963E  The DB2 group attach name cannot be blank when the DB2 subsystem ID is blank.

Explanation:  A DB2 group attach name, DB2 subsystem ID, or both must be specified.

System action:  Processing stops.

User response:  Specify a DB2 group attach name, DB2 subsystem ID, or both.

CCQH001W  The specified option option_name is not valid.

Explanation:  The option that was specified is not a valid option on the panel.

System action:  Tools Customizer stops.

User response:  Specify a valid option on the panel.

CCQH006W  Before you customize a component, verify your user settings.

Explanation:  The user settings must be verified before a component can be customized.

System action:  Tools Customizer stops.

User response:  Verify the user settings.

CCQH007E  Check the user settings. One or more current values are not valid.

Explanation:  One or more of the values in the user settings is not valid.

System action:  Tools Customizer stops.

User response:  Ensure that the specified values for the user settings are valid.

CCQH008W  Before you use Tools Customizer, you must select option 0 to verify your user settings.

Explanation:  The user settings must be changed before a component can be customized.

System action:  Tools Customizer stops.

User response:  Change the user settings.

CCQH009E  You must select option 0 to change your user settings.

Explanation:  User settings must be changed before a component can be customized.

System action:  Tools Customizer stops.

User response:  Change the user settings.

CCQI000W  The XML structure of the member_name DB2 parameter metadata member is not valid. The PL/I XML parser issued the following exception warning code: code_number.

Explanation:  While determining if the DB2 parameter metadata member is valid, the PL/I XML parser issued an exception warning code.

System action:  Processing continues.

User response:  See the Enterprise PL/I for z/OS Programming Guide for more information about the exception warning code.
The XML structure of the `member_name` DB2 parameter metadata member is not valid. The PL/I XML parser issued the following exception error code:

code_number.

Explanation: While determining if the DB2 parameter metadata member is valid, the PL/I XML parser issued an exception error code.

System action: Processing stops.

User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the exception warning code.

The XML structure of the `member_name` DB2 parameter metadata member is not valid. The `element_name` element is unknown.

Explanation: The specified element in the DB2 parameter metadata member is unknown.

System action: Processing stops.

The XML structure of the `member_name` DB2 parameter metadata member is not valid. Content is not allowed for the `element_name` element, but content was found.

Explanation: The specified element cannot contain content.

System action: Processing stops.

The XML structure of the `member_name` DB2 parameter metadata member is not valid. Content is required for the `element_name` element, but content was not found.

Explanation: The specified element requires content.

System action: Processing stops.

The XML structure of the `member_name` DB2 parameter metadata member is not valid. The `element_name` element must occur at least `minimum_number` times.

Explanation: The specified element does not occur enough times.

System action: Processing stops.

The XML structure of the `member_name` DB2 parameter metadata member is not valid. The `attribute_name` attribute in the `element_name` element cannot occur more than `maximum_number` times.

Explanation: The specified attribute occurs too many times.

System action: Processing stops.

CCQI009S  The XML structure of the member_name DB2 parameter metadata member is not valid. The attribute_name attribute in the element_name element must occur at least minimum_number times.

Explanation: The specified attribute did not occur enough times.

System action: Processing stops.

CCQI010S  The XML structure of the member_name DB2 parameter metadata member is not valid. Content is not allowed for the attribute_name attribute in the element_name element, but content was found.

Explanation: The specified attribute cannot have content.

System action: Processing stops.

CCQI011S  The XML structure of the member_name DB2 parameter metadata member is not valid. Content is required for the attribute_name attribute in the element_name element, but content was not found.

Explanation: The specified attribute is missing required content.

System action: Processing stops.

CCQI012S  The XML structure of the member_name DB2 parameter metadata member is not valid. The content length for the element_name element cannot exceed maximum_number characters.

Explanation: The specified element contains too many characters.

System action: Processing stops.

CCQI013S  The XML structure of the member_name DB2 parameter metadata member is not valid. The attribute_name attribute in the element_name element is unknown.

Explanation: The specified attribute in the DB2 parameter metadata member is unknown.

System action: Processing stops.

CCQI014S  The content of the member_name DB2 parameter metadata member is not valid because the value of the element_name element is incorrect. The value is value_name.

Explanation: The specified value of the element is not a valid value.

System action: Processing stops.

CCQI015S  The content of the member_name DB2 parameter metadata member is not valid because the value of the attribute_name attribute in the element_name element is incorrect. The value of the attribute is value_name.

Explanation: The specified value of the attribute is not a valid value.

System action: Processing stops.

CCQI016S  The content of the DB2 parameter metadata member is not valid because the data type of the element_name element is incorrect. The value is value_name.

Explanation: The specified data type is not a valid data type.

System action: Processing stops.

The content of the DB2 parameter metadata member is not valid because the data type of the attribute_name attribute in the element_name element is incorrect. The value of the attribute is value_name.

Explanation: The specified data type is not a valid data type.

System action: Processing stops.

The member_name DB2 parameter metadata member was not found in the data_set_name data set.

Explanation: Tools Customizer could not find the specified DB2 parameter metadata member.

System action: Processing stops.

The parameter_name LPAR parameter in the template_name template does not have associated metadata in the member_name LPAR parameter metadata member.

Explanation: The specified template does not contain metadata for an LPAR parameter. The name of the LPAR parameter metadata member, the name of the LPAR parameter, and the name of the template are indicated in the message text.

System action: Processing stops.

The parameter_name component parameter in the template_name template does not have associated metadata in the member_name component parameter metadata member.

Explanation: The specified template does not contain metadata for a component parameter. The name of the component parameter metadata member, the name of the component parameter, and the name of the template are indicated in the message text.

System action: Processing stops.

The member_name component parameter metadata member was not found in the data_set_name data set.

Explanation: The component parameter metadata member was not found in the specified data set.

System action: Processing stops.

CCQI058I  component_name does not have any DB2 parameters.
Explanation:  DB2 parameters are not required to customize the specified component.
System action:  Processing continues.
User response:  No action is required.

CCQI059I  component_name does not have any LPAR parameters.
Explanation:  LPAR parameters are not required to customize the specified component.
System action:  Processing continues.
User response:  No action is required.

CCQI060S  The parameter_name DB2 parameter in the task_description task condition does not have associated metadata in the member_name DB2 parameter metadata member.
Explanation:  Associated metadata is missing for the specified DB2 parameter in a task.
System action:  Processing stops.

CCQI061S  The parameter_name LPAR parameter in the task_description task condition does not have associated metadata in the member_name LPAR parameter metadata member.
Explanation:  Associated metadata is missing for the specified LPAR parameter in a task.
System action:  Processing stops.

CCQI062S  The parameter_name component parameter in the task_description task condition does not have associated metadata in the member_name component parameter metadata member.
Explanation:  Associated metadata is missing for the specified component parameter in a task.
System action:  Processing stops.

CCQI063S  The parameter_name DB2 parameter in the task_description task and the step_description step does not have associated metadata in the member_name DB2 parameter metadata member.
Explanation:  Associated metadata is missing for the specified DB2 parameter in a task and step.
System action:  Processing stops.

CCQI064S  The parameter_name LPAR parameter in the task_description task and the step_description step does not have associated metadata in the member_name LPAR parameter metadata member.
Explanation:  Associated metadata is missing for the specified LPAR parameter in a task and step.
System action:  Processing stops.

CCQI065S  The parameter_name component parameter in the task_description task and the step_description step does not have associated metadata in the member_name component parameter metadata member.
Explanation:  Associated metadata is missing for the specified parameter in a task and step.
System action:  Processing stops.

CCQI066S  The parameter_name DB2 parameter in the task_description task, step_description step, and template_name template condition does not have associated metadata in the member_name DB2 parameter metadata member.
Explanation:  Associated metadata is missing for the specified DB2 parameter in a task, step, and template.
System action:  Processing stops.

CCQI074S The XML structure of the member_name LPAR parameter metadata member is not valid. The following value of the attribute_name attribute in the element_name element already exists: value_name.

Explanation: The specified value already exists for an attribute.

System action: Processing stops.

CCQI075S The XML structure of the member_name component parameter metadata member is not valid. The following value of the attribute_name attribute in the element_name element already exists: value_name.

Explanation: The specified value already exists for an attribute.

System action: Processing stops.

CCQI076S The XML structure of the member_name DB2 parameter metadata member is not valid. The parameter_name parameter refers to the section-name section. This section was not found in the DB2 parameter metadata member.

Explanation: The specified value already exists for an attribute.

System action: Processing stops.

CCQI077S The XML structure of the member_name LPAR parameter metadata member is not valid. The parameter_name parameter refers to the section-name section. This section was not found in the LPAR parameter metadata member.

Explanation: The specified value already exists for an attribute.

System action: Processing stops.

CCQI078S The XML structure of the member_name component parameter metadata member is not valid. The parameter_name parameter refers to the section-name section. This section was not found in the component parameter metadata member.

Explanation: The specified parameter refers to a section that is not in the component parameter metadata member.

System action: Processing stops.

CCQI080S The content of the member_name DB2 parameter metadata member is not valid because the value of the attribute_name attribute in the element_name element is incorrect. The value of the attribute is value_name.

Explanation: The specified value for an attribute in the DB2 parameter metadata member is not valid.

System action: Processing stops.

CCQI081S The content of the member_name LPAR parameter metadata member is not valid because the value of the attribute_name attribute in the element_name element is incorrect. The value of the attribute is value_name.

Explanation: The specified value for an attribute in the LPAR parameter metadata member is not valid.

System action: Processing stops.

CCQI082S The content of the member_name component parameter metadata member is not valid because the value of the attribute_name attribute in the element_name element is incorrect. The value of the attribute is value_name.

Explanation: The specified value for an attribute in the component parameter metadata member is not valid.

System action: Processing stops.

CCQI090S  The component-defined DB2 parameter
parameter_name in the member_name
parameter metadata member references the
section_ID section ID, but this ID does not exist in either the parameter
metadata member or the DB2 parameter
metadata member.

Explanation: A section that does not exist in the
parameter metadata member or the DB2 parameter
metadata member is referenced by the specified DB2 parameter.

System action: Processing stops.

User response: See “Gathering diagnostic
information” on page 215. Contact IBM Software
Support.

CCQI091S  The component-defined LPAR
parameter in the member_name parameter
metadata member references the
section_ID section ID, but this ID does not exist in either the parameter
metadata member or the LPAR
parameter metadata member.

Explanation: A section that does not exist in the
parameter metadata member or the LPAR parameter
metadata member is being referenced by the specified LPAR parameter.

System action: Processing stops.

User response: See “Gathering diagnostic
information” on page 215. Contact IBM Software
Support.

CCQI092S  The overridden DB2 parameter
parameter_name in the member_name parameter
metadata member does not exist in the DB2 parameter metadata
member.

Explanation: The specified parameter does not exist.

System action: Processing stops.

User response: See “Gathering diagnostic
information” on page 215. Contact IBM Software
Support.

CCQI093S  The overridden LPAR parameter
parameter_name in the member_name parameter
metadata member does not exist in the LPAR parameter metadata
member.

Explanation: The specified parameter does not exist.

System action: Processing stops.

User response: See “Gathering diagnostic
information” on page 215. Contact IBM Software
Support.

CCQI094S  The CCQ$$PRD product customization
parameter metadata member was not
found in the data_set_name data set.

Explanation: The specified data set must contain the
CCQ$$PRD product customization parameter metadata
member

System action: Processing stops.

User response: See “Gathering diagnostic
information” on page 215. Contact IBM Software
Support.

CCQI100W  The XML structure of the member_name
LPAR parameter metadata member is
not valid. The PL/I XML parser issued
the following exception warning code:
code_number.

Explanation: While determining if the LPAR
parameter metadata member is valid, the PL/I XML
parser issued an exception warning code.

System action: Processing continues.

User response: See the Enterprise PL/I for z/OS
Programming Guide for more information about the
exception warning code.

CCQI101S  The XML structure of the member_name
LPAR parameter metadata member is
not valid. The PL/I XML parser issued
the following exception error code:
code_number.

Explanation: While determining if the LPAR
parameter metadata member is valid, the PL/I XML
parser issued an exception error code.

System action: Processing stops.

User response: See the Enterprise PL/I for z/OS
Programming Guide for more information about the
exception warning code.

CCQI102S  The XML structure of the member_name
LPAR parameter metadata member is
not valid. The element_name element is
unknown.

Explanation: The specified element in the LPAR
parameter metadata member is unknown.

System action: Processing stops.

User response: See “Gathering diagnostic
information” on page 215. Contact IBM Software
Support.
CCQI103S The XML structure of the member_name LPAR parameter metadata member is not valid. Content is not allowed for the element_name element, but content was found.

Explanation: The specified element cannot contain content.

System action: Processing stops.

CCQI104S The XML structure of the member_name LPAR parameter metadata member is not valid. Content is required for the element_name element, but content was not found.

Explanation: The specified element requires content.

System action: Processing stops.

CCQI105S The XML structure of the member_name LPAR parameter metadata member is not valid. The content length for the element_name element cannot exceed maximum_number characters.

Explanation: The specified element contains too many characters.

System action: Processing stops.

CCQI106S The XML structure of the member_name LPAR parameter metadata member is not valid. The content length for the element_name element must be at least minimum_number characters.

Explanation: The specified element does not contain enough characters.

System action: Processing stops.

CCQI107S The XML structure of the member_name LPAR parameter metadata member is not valid. The element_name element must occur at least minimum_number times.

Explanation: The specified element does not occur enough times.

System action: Processing stops.

CCQI108S The XML structure of the member_name LPAR parameter metadata member is not valid. The attribute_name attribute in the element_name element cannot occur more than maximum_number times.

Explanation: The specified attribute occurs too many times.

System action: Processing stops.

CCQI109S The XML structure of the member_name LPAR parameter metadata member is not valid. The attribute_name attribute in the element_name element must occur at least minimum_number times.

Explanation: The specified attribute did not occur enough times.

System action: Processing stops.

CCQI110S The XML structure of the member_name LPAR parameter metadata member is not valid. Content is not allowed for the attribute_name attribute in the element_name element, but content was found.

Explanation: The specified attribute cannot have content.

System action: Processing stops.

CCQI111S The XML structure of the member_name LPAR parameter metadata member is not valid. Content is required for the attribute_name attribute in the element_name element, but content was not found.

Explanation: The specified attribute is missing required content.

System action: Processing stops.

CCQI112S The XML structure of the member_name LPAR parameter metadata member is not valid. The content length for the element_name element cannot exceed maximum_number characters.

Explanation: The specified element contains too many characters.

System action: Processing stops.

CCQI113S The XML structure of the member_name LPAR parameter metadata member is not valid. The attribute_name attribute in the element_name element is unknown.

Explanation: The specified attribute in the LPAR parameter metadata member is unknown.

System action: Processing stops.

CCQI114S The content of the member_name LPAR parameter metadata member is not valid because the value of the element_name element is incorrect. The value is value_name.

Explanation: The specified value for an element in the LPAR parameter metadata member is not valid.

System action: Processing stops.

CCQI115S The content of the member_name LPAR parameter metadata member is not valid because the value of the attribute_name attribute in the element_name element is incorrect. The value of the attribute is value_name.

Explanation: The specified value for an attribute in the LPAR parameter metadata member is not valid.

System action: Processing stops.

CCQI116S The content of the member_name LPAR parameter metadata member is not valid because the data type of the element_name element is incorrect. The value is value_name.

Explanation: The specified data type value for an element in the LPAR parameter metadata member is not valid.

System action: Processing stops.

CCQI117S The content of the member_name LPAR parameter metadata member is not valid because the data type of the attribute_name attribute in the element_name element is incorrect. The value is value_name.

Explanation: The specified data type value for an attribute in the LPAR parameter metadata member is not valid.

System action: Processing stops.

CCQI120S The XML structure of the member_name DB2 parameter metadata member is not valid. The element_name element in the parameter_name parameter contains duplicate values for the element_name element. The duplicate value is value_name.

Explanation: An element contains the specified duplicate value.

System action: Processing stops.

CCQI121S  The XML structure of the member_name LPAR parameter metadata member is not valid. The element_name element in the parameter_name parameter contains duplicate values for the element_name element. The duplicate value is value_name.

Explanation: An element contains the specified duplicate value.

System action: Processing stops.

CCQI200W  The XML structure of the member_name information metadata member is not valid. The PL/I XML parser issued the following exception warning code: code_number.

Explanation: While determining if the information metadata member is valid, the PL/I XML parser issued an exception warning code.

System action: Processing continues.

User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the exception warning code.

CCQI201S  The XML structure of the member_name information metadata member is not valid. The element_name element is unknown.

Explanation: The specified element in the information metadata member is unknown.

System action: Processing stops.

User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the exception warning code.

CCQI202S  The XML structure of the member_name information metadata member is not valid. Content is not allowed for the element_name element, but content was found.

Explanation: The specified element cannot contain content.

System action: Processing stops.
CCQI204S  The XML structure of the member_name information metadata member is not valid. Content is required for the element_name element, but content was not found.

Explanation: The specified element requires content.

System action: Processing stops.

CCQI204S  The XML structure of the member_name information metadata member is not valid. The attribute_name attribute in the element_name element cannot occur more than maximum_number times.

Explanation: The specified attribute occurs too many times.

System action: Processing stops.

CCQI205S  The XML structure of the member_name information metadata member is not valid. The content length for the element_name element cannot exceed maximum_number characters.

Explanation: The specified element contains too many characters.

System action: Processing stops.

CCQI206S  The XML structure of the member_name information metadata member is not valid. The content length for the element_name element must be at least minimum_number characters.

Explanation: The specified element does not contain enough characters.

System action: Processing stops.

CCQI207S  The XML structure of the member_name information metadata member is not valid. The element_name element must occur at least minimum_number times.

Explanation: The specified element does not occur enough times.

System action: Processing stops.

CCQI208S  The XML structure of the member_name information metadata member is not valid. Content is required for the attribute_name attribute in the element_name element, but content was not found.

Explanation: The specified attribute is missing required content.

System action: Processing stops.

CCQI209S  The XML structure of the member_name information metadata member is not valid. The attribute_name attribute in the element_name element must occur at least minimum_number times.

Explanation: The specified attribute did not occur enough times.

System action: Processing stops.

CCQI210S  The XML structure of the member_name information metadata member is not valid. Content is not allowed for the attribute_name attribute in the element_name element, but content was found.

Explanation: The specified attribute cannot have content.

System action: Processing stops.

CCQI211S  The XML structure of the member_name information metadata member is not valid. Content is required for the attribute_name attribute in the element_name element, but content was not found.

Explanation: The specified attribute is missing required content.

System action: Processing stops.

CCQI212S The XML structure of the member_name information metadata member is not valid. The content length for the element_name element cannot exceed maximum_number characters.

Explanation: The specified element contains too many characters.

System action: Processing stops.

CCQI213S The XML structure of the member_name information metadata member is not valid. The attribute_name attribute in the element_name element is unknown.

Explanation: The specified attribute in the information metadata member is unknown.

System action: Processing stops.

CCQI214S The content of the member_name information metadata member is not valid because the value of the element_name element is incorrect. The value is value_name.

Explanation: The specified value for an element in the information metadata member is not valid.

System action: Processing stops.

CCQI215S The content of the member_name information metadata member is not valid because the value of the attribute_name attribute in the element_name element is incorrect. The value is value_name.

Explanation: The specified value for an attribute in the information metadata member is not valid.

System action: Processing stops.

CCQI216S The content of the member_name information metadata member is not valid because the data type of the element_name element is incorrect. The value is value_name.

Explanation: The specified data type value for an element in the information metadata member is not valid.

System action: Processing stops.

CCQI217S The content of the member_name information metadata member is not valid because the data type of the attribute_name attribute in the element_name element is incorrect. The value is value_name.

Explanation: The specified data type value for an attribute in the information metadata member is not valid.

System action: Processing stops.

CCQI218S The content of the member_name information metadata member is not valid. The length of the value_name value that of the attribute_name attribute is longer than the value_name value of the attribute_name attribute.

Explanation: The first specified value cannot be longer than the second specified value.

System action: Processing stops.

CCQI219S The content of the member_name information metadata member is not valid. The value_name value of the attribute_name attribute contains the value_name value.

Explanation: The first specified value cannot be longer than the second specified value.

System action: Processing stops.

CCQI220S The XML structure of the *member_name* information metadata member is not valid. Content for the *attribute_name* attribute in the *element_name* element exceed *maximum_number* characters.

Explanation: The specified attribute contains too many characters.

System action: Processing stops.

---

CCQI223S The XML structure of the *member_name* information metadata member is not valid. The value that is specified for the DB2 Level already exists. The value is *value_name*.

Explanation: The specified value already exists.

System action: Processing stops.

User response: Specify a different DB2 level. If the problem persists, contact IBM Software Support.

---

CCQI224S The XML structure of the *member_name* information metadata member is not valid. The value that is specified for the DB2 Mode already exists. The value is *value_name*.

Explanation: The specified value already exists.

System action: Processing stops.

User response: Specify a different DB2 mode. If the problem persists, contact IBM Software Support.

---

CCQI250S The information metadata member was not found in the *data_set_name* data set.

Explanation: Tools Customizer could not find the information metadata member in the specified data set.

System action: Processing stops.

User response: If this message was issued on the Specify the Metadata Library (CCQPHLQ) panel, specify the product metadata library. The name of this library is hlq.SDENU.

Do not specify the Tools Customizer metadata library, which is hlq.SCCQDENU.

If the problem persists, identify the name of the Tools Customizer trace data set and contact IBM Software Support.

---

CCQI251E The *member_name* member was not accessible in the *data_set_name* data set.

Explanation: The specified member could not be accessed in the data set.

System action: Processing stops.

User response: Specify the correct metadata library.

---

CCQI252S The information metadata member was not found in the *library_name* component metadata library that is part of the *library_name* pack metadata library. The name of the pack is *pack_name*.

Explanation: The specified component metadata library does not contain the information metadata member.

System action: Processing stops.

User response: Specify the correct metadata library.

---

CCQI253E The *library_name* Tools Customizer metadata library is not current. Update the metadata library on the Tools Customizer Settings panel.

Explanation: The specified metadata library is not current.

System action: Processing stops.

User response: Specify a current metadata library on the Tools Customizer Settings panel.

---

CCQI300W The XML structure of the *member_name* sequence metadata member is not valid. The PL/I XML parser issued the following exception warning code: *code_number*.

Explanation: While determining if the sequence metadata member is valid, the PL/I XML parser issued an exception warning code.

System action: Processing continues.

User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the exception warning code.

---

CCQI301S The XML structure of the *member_name* sequence metadata member is not valid. The PL/I XML parser issued the following exception error code: *code_number*.

Explanation: While determining if the sequence metadata member is valid, the PL/I XML parser issued an exception error code.

System action: Processing stops.
User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the exception error code, and contact IBM Software Support.

CCQI302S The XML structure of the member_name sequence metadata member is not valid. The element_name element is unknown.

Explanation: The specified element in the sequence metadata member is unknown.

System action: Processing stops.

CCQI303S The XML structure of the member_name sequence metadata member is not valid. Content is not allowed for the element_name element, but content was found.

Explanation: The specified element cannot contain content.

System action: Processing stops.

CCQI304S The XML structure of the member_name sequence metadata member is not valid. Content is required for the element_name element, but content was not found.

Explanation: The specified element is missing required content.

System action: Processing stops.

CCQI305S The XML structure of the member_name sequence metadata member is not valid. Content length for the element_name element cannot exceed maximum_number characters.

Explanation: The specified element contains too many characters.

System action: Processing stops.

CCQI306S The XML structure of the member_name sequence metadata member is not valid. The element_name element cannot occur more than maximum_number times.

Explanation: The specified element occurs too many times.

System action: Processing stops.

CCQI307S The XML structure of the member_name sequence metadata member is not valid. The element_name element must occur at least minimum_number times.

Explanation: The specified element does not occur enough times.

System action: Processing stops.

CCQI308S The XML structure of the member_name sequence metadata member is not valid. The attribute_name attribute in the element_name element cannot occur more than maximum_number times.

Explanation: The specified attribute occurs too many times.

System action: Processing stops.

CCQI309S The XML structure of the member_name sequence metadata member is not valid. The attribute_name attribute in the element_name element must occur at least minimum_number times.

Explanation: The specified attribute does not occur enough times.

System action: Processing stops.

CCQI310S The XML structure of the member_name sequence metadata member is not valid. Content is not allowed for the attribute_name attribute in the element_name element, but content was found.
CCQI311S  CCQI350S

Explanation: The specified attribute cannot contain content.

System action: Processing stops.

CCQI311S  The XML structure of the member_name sequence metadata member is not valid. Content is required for the attribute_name attribute in the element_name element, but content was not found.

Explanation: The specified attribute is missing required content.

System action: Processing stops.

CCQI312S  The XML structure of the member_name sequence metadata member is not valid. The content length for the element_name element cannot exceed maximum_number characters.

Explanation: The specified element contains too many characters.

System action: Processing stops.

CCQI313S  The XML structure of the member_name sequence metadata member is not valid. The attribute_name attribute in the element_name element is unknown.

Explanation: The specified attribute in the sequence metadata member is unknown.

System action: Processing stops.

CCQI314S  The content of the member_name sequence metadata member is not valid because the value of the element_name element is incorrect. The value is value_name.

Explanation: A specified value for an attribute in the sequence metadata member is not valid.

System action: Processing stops.

CCQI351S  The member_name sequence metadata member was not found in the data_set_name metadata data set.

Explanation: Tools Customizer could not find the specified sequence metadata member in the metadata data set.

System action: Processing stops.

CCQI352S  The template_name component template was not found in the data_set_name metadata data set.

Explanation: Tools Customizer could not find the specified component template in the data set.

System action: Processing stops.

CCQI353S  The sequence metadata member was not found in the data_set_name component data set that is part of the data_set_name pack.

Explanation: Tools Customizer could not find the sequence metadata member.

System action: Processing stops.

CCQI360S  The XML structure of the member_name sequence metadata member is not valid. The value of the attribute_name attribute in the element_name element already exists.

Explanation: Tools Customizer could not find the specified attribute contains a value that already exists.

System action: Processing stops.

CCQI361S  The XML structure of the member_name sequence metadata member is not valid. A relational operator already exists for the condition element on the specified level.

Explanation: A relational operator already exists for the condition element on the specified level.

System action: Processing stops.

CCQI362S  The XML structure of the member_name sequence metadata member is not valid. The condition element on the level_type level must contain only one content string or content number element.

Explanation: Tools Customizer could not find the specified sequence metadata member in the metadata data set.

System action: Processing stops.

CCQI363S  The XML structure of the member_name sequence metadata member is not valid. The condition element in the element_name element with the attribute_name attribute must contain either the content string element or content number element.

Explanation: Tools Customizer could not find the specified sequence metadata member in the metadata data set.

System action: Processing stops.

CCQI400W  The XML structure of the member_name parameter metadata member is not valid. The PL/I XML parser issued the following exception warning code: code_number.

Explanation: While determining if the parameter metadata member is valid, the PL/I XML parser issued an exception warning code.

System action: Processing continues.

User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the exception warning code.

CCQI401S  The XML structure of the member_name parameter metadata member is not valid. The PL/I XML parser issued the following exception error code: code_number.

Explanation: While determining if the parameter metadata member is valid, the PL/I XML parser issued an exception error code.

System action: Processing continues.

User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the exception error code.
metadata member is valid, the PL/I XML parser issued an exception error code.

System action: Processing stops.

User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the exception warning code.

CCQI402S  The XML structure of the member_name parameter metadata member is not valid. The element_name element is unknown.

Explanation: The specified element in the parameter metadata member is unknown.

System action: Processing stops.

CCQI403S  The XML structure of the member_name parameter metadata member is not valid. Content is not allowed for the element_name element, but content was found.

Explanation: The specified element cannot contain content.

System action: Processing stops.

CCQI404S  The XML structure of the member_name parameter metadata member is not valid. Content is required for the element_name element, but content was not found.

Explanation: The specified element requires content.

System action: Processing stops.

CCQI405S  The XML structure of the member_name parameter metadata member is not valid. The content length for the element_name element cannot exceed maximum_number characters.

Explanation: The specified element contains too many characters.

System action: Processing stops.

CCQI406S  The XML structure of the member_name parameter metadata member is not valid. The content length for the element_name element must be at least minimum_number characters.

Explanation: The specified element does not contain enough characters.

System action: Processing stops.

CCQI407S  The XML structure of the member_name parameter metadata member is not valid. The element_name element must occur at least minimum_number times.

Explanation: The specified element does not occur enough times.

System action: Processing stops.

CCQI408S  The XML structure of the member_name parameter metadata member is not valid. The attribute_name attribute in the element_name element cannot occur more than maximum_number times.

Explanation: The specified attribute occurs too many times.

System action: Processing stops.

CCQI409S  The XML structure of the member_name parameter metadata member is not valid. The attribute_name attribute in the element_name element must occur at least minimum_number times.

Explanation: The specified attribute does not occur enough times.

System action: Processing stops.

CCQI420S  The XML structure of the member_name parameter metadata member is not valid. The element_name element is unknown for the overridden DB2 parameter.

Explanation:  
System action:  Processing stops.  

CCQI421S  The XML structure of the member_name parameter metadata member is not valid. The element_name element is unknown for the overridden LPAR parameter.

Explanation:  
System action:  Processing stops.  

CCQI422S  The XML structure of the member_name parameter metadata member is not valid. The attribute_name attribute in the element_name element is unknown for the overridden DB2 parameter.

Explanation:  
System action:  Processing stops.  

CCQI423S  The XML structure of the member_name parameter metadata member is not valid. The attribute_name attribute in the element_name element is unknown for the overridden LPAR parameter.

Explanation:  
System action:  Processing stops.  

CCQI510W  The data_set_name data store data set does not exist.

Explanation:  
The specified data store data set does not exist.  
System action:  Processing continues.  
User response:  Ensure that the data store data set exists.

CCQI511S  The data_set_name data store data set cannot be opened by using the disposition_type disposition.

Explanation:  
The specified data store data set could not be opened with the specified disposition.  
System action:  Processing continues.  

CCQI512S  The data_set_name data store data set cannot be opened by using the option-type option.

Explanation:  
The specified data store data set was unable to be opened with the specified option.  
System action:  Processing stops.  

CCQI600W  The XML structure of the member_name component customization parameter metadata member is not valid. The PL/I XML parser issued the following exception warning code: code_number.

Explanation:  
While determining if the component customization parameter metadata member is valid, the PL/I XML parser issued an exception warning code. 
System action:  Processing continues.  
User response:  See the Enterprise PL/I for z/OS Programming Guide for more information about the warning.

CCQI601S  The XML structure of the member_name component customization parameter metadata member is not valid. The PL/I XML parser issued the following exception error code: code_number.

Explanation:  
While determining if the component customization parameter metadata member is valid, the PL/I XML parser issued an exception error code.  
System action:  Processing stops.  
customization parameter metadata member is valid, the PL/I XML parser issued an exception error code.

System action: Processing continues.

User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the warning.

CCQI602S The XML structure of the member_name component customization parameter metadata member is not valid. The element_name element is unknown.

Explanation: The specified component customization parameter metadata member contains an unknown element.

System action: Processing continues.

CCQI603S The XML structure of the member_name component customization parameter metadata member is not valid. Content is not allowed for the element_name element, but content was found.

Explanation: Content was found in an element that cannot contain content.

System action: Processing stops.

CCQI604S The XML structure of the member_name component customization parameter metadata member is not valid. Content is required for the element_name element, but content was not found.

Explanation: The specified element does not contain required content.

System action: Processing stops.

CCQI605S The XML structure of the member_name component customization parameter metadata member is not valid. The content length for the element_name element ‘cannot exceed maximum_number characters.

Explanation: The specified element contains too many characters.

System action: Processing stops.

CCQI606S The XML structure of the member_name component customization parameter metadata member is not valid. The element_name element cannot occur more than maximum_number times.

Explanation: The specified element occurs too many times in the component customization parameter metadata member.

System action: Processing stops.

CCQI607S The XML structure of the member_name component customization parameter metadata member is not valid. The element_name element must occur at least minimum_number times.

Explanation: The specified element does not occur enough times in the component customization parameter metadata member.

System action: Processing stops.

CCQI608S The XML structure of the member_name component customization parameter metadata member is not valid. The attribute_name attribute in the element_name element cannot occur more than maximum_number times.

Explanation: The specified attribute occurs too many times in the component customization parameter metadata member.

System action: Processing stops.

CCQI609S The XML structure of the member_name component customization parameter metadata member is not valid. The attribute_name attribute in the element_name element must occur at least minimum_number times.

Explanation: The specified attribute does not occur enough times in the component customization parameter metadata member.

| CCQI613S The XML structure of the member_name component customization parameter metadata member is not valid. The specified component customization parameter metadata member contains an unknown attribute. |
| Explanation: | The specified component customization parameter metadata member contains an unknown attribute. |
| System action: | Processing stops. |

| CCQI614S The XML structure of the member_name component customization parameter metadata member is not valid. The value of the element_name element is not valid. The value value_name. |
| Explanation: | The specified value of the element is not a valid value. |
| System action: | Processing stops. |

| CCQI615S The XML structure of the member_name component customization parameter metadata member is not valid. The value of the attribute_name attribute for the element_name element is not valid. The value is value_name. |
| Explanation: | The specified value of the attribute is not a valid value. |
| System action: | Processing stops. |

| CCQI616S The XML structure of the member_name component customization parameter metadata member is not valid. The data type of the element_name element is not valid. The value of the element is value_name. |
| Explanation: | The specified data type is not a valid data type. |
| System action: | Processing stops. |

| CCQI617S The XML structure of the member_name component customization parameter metadata member is not valid. The data type of the attribute_name attribute for the element_name element is not valid. The value of the attribute is value_name. |
| Explanation: | The specified data type is not a valid data type. |
| System action: | Processing stops. |

**CCQI650S** The XML structure of the `member_name` component customization parameter metadata member is not valid. The following value of the `attribute_name` attribute in the `element_name` element already exists: `value_name`.

**Explanation:** The specified value for an attribute already exists.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 215. Contact IBM Software Support.

**CCQI651S** The XML structure of the `member_name` component customization parameter metadata member is not valid. The `parameter_name` parameter refers to the following section, which was not found in the `member_name` component customization parameter metadata member: `section-name`.

**Explanation:** The specified section is not in the component customization parameter metadata member.

**System action:** Processing stops.

**User response:** See the Enterprise PL/I for z/OS Programming Guide for more information about the warning.

**CCQI652S** The `member_name` component customization metadata member is not valid. The default length for the `element_name` parameter element exceeds the length of the parameter. The default length is `default_length`, and the specified length is `specified_length`. The default length will be truncated accordingly.

**Explanation:** The specified length cannot be shorter than the default length.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 215. Contact IBM Software Support.

**CCQI653S** The content of the `member_name` component customization parameter metadata member is not valid. The value of the `attribute_name` attribute in the `element_name` element is not valid. The value of the attribute is `value_name`.

**Explanation:** Content was found in an element that cannot contain content.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 215. Contact IBM Software Support.

**CCQI700W** The XML structure of the `member_name` solution pack metadata member is not valid. The PL/I XML parser issued the following exception warning code: `code_number`.

**Explanation:** While determining if the specified solution pack metadata member is valid, the PL/I XML parser issued an exception warning code.

**System action:** Processing continues.

**User response:** See the Enterprise PL/I for z/OS Programming Guide for more information about the warning.

**CCQI701S** The XML structure of the `member_name` solution pack metadata member is not valid. The PL/I XML parser issued the following exception error code: `code_number`.

**Explanation:** While determining if the specified solution pack metadata member is valid, the PL/I XML parser issued an exception error code.

**System action:** Processing stops.

**User response:** See the Enterprise PL/I for z/OS Programming Guide for more information about the error.

**CCQI702S** The XML structure of the `member_name` solution pack metadata member is not valid. The `element_name` element is unknown.

**Explanation:** The specified solution pack metadata member contains an unknown element.

**System action:** Processing stops.

**User response:** See “Gathering diagnostic information” on page 215. Contact IBM Software Support.

**CCQI703S** The XML structure of the `member_name` solution pack metadata member is not valid. Content is not allowed for the `element_name` element, but content was found.

**Explanation:** Content was found in an element that cannot contain content.

**System action:** Processing stops.

CCQI704S  The XML structure of the member_name solution pack metadata member is not valid. Content is required for the element_name element, but content was not found.

Explanation: The specified element does not contain required content.

System action: Processing stops.

CCQI705S  The XML structure of the member_name solution pack metadata member is not valid. The content length for the element_name element cannot exceed maximum_number characters.

Explanation: The specified element contains too many characters.

System action: Processing stops.

CCQI706S  The XML structure of the member_name solution pack metadata member is not valid. The element_name element cannot occur more than maximum_number times.

Explanation: The specified element occurs too many times.

System action: Processing stops.

CCQI707S  The XML structure of the member_name solution pack metadata member is not valid. The element_name element must occur at least minimum_number times.

Explanation: The specified element does not occur enough times.

System action: Processing stops.

CCQI708S  The XML structure of the member_name solution pack metadata member is not valid. The attribute_name attribute in the element_name element cannot occur more than maximum_number times.

Explanation: The specified attribute occurs too many times.

System action: Processing stops.

CCQI709S  The XML structure of the member_name solution pack metadata member is not valid. The attribute_name attribute in the element_name element must occur at least minimum_number times.

Explanation: The specified attribute does not occur enough times.

System action: Processing stops.

CCQI710S  The XML structure of the member_name solution pack metadata member is not valid. Content is not allowed for the attribute_name attribute in the element_name element, but content was found.

Explanation: The specified attribute cannot have content.

System action: Processing stops.

CCQI711S  The XML structure of the member_name solution pack metadata member is not valid. Content is required for the attribute_name attribute in the element_name element, but content was not found.

Explanation: The specified attribute is missing content.

System action: Processing stops.

CCQI712S  The XML structure of the member_name solution pack metadata member is not valid. The content length for the attribute_name attribute in the element_name element cannot exceed maximum_number characters.

Explanation:  The specified attribute contains too many characters.

System action:  Processing stops.

CCQI713S  The XML structure of the member_name solution pack metadata member is not valid. The attribute_name attribute in the element_name element is unknown.

Explanation:  The specified attribute in the solution pack metadata member is unknown.

System action:  Processing stops.

CCQI714S  The XML structure of the member_name solution pack metadata member is not valid because the value of the element_name element is incorrect. The value is value_name.

Explanation:  The specified value of the element is not a valid value.

System action:  Processing stops.

CCQI715S  The XML structure of the member_name solution pack metadata member is not valid because the value of the attribute_name attribute in the element_name element is incorrect. The value of the attribute is value_name.

Explanation:  The specified data type is not a valid data type.

System action:  Processing stops.

CCQI716S  The XML structure of the member_name solution pack metadata member is not valid because the data type of the element_name element is incorrect. The value is value_name.

Explanation:  The specified data type is not a valid data type.

System action:  Processing stops.

CCQI717S  The XML structure of the member_name solution pack metadata member is not valid because the data type of the attribute_name attribute in the element_name element is incorrect. The value of the attribute is value_name.

Explanation:  The specified data type is not a valid data type.

System action:  Processing stops.

CCQI720S  The XML structure of the member_name solution pack metadata member is not valid. The msg element is required for the component_name component that is not customizable.

Explanation:  The msg element is required for the specified component, which cannot be customized by using Tools Customizer.

System action:  Processing stops.

CCQI750S  The solution pack metadata member was not found in the library_name metadata library.

Explanation:  Tools Customizer could not find the solution pack metadata member in the specified library.

System action:  Processing stops.

CCQI751S The version in the library_name solution pack metadata library is different than the version in the library_name component metadata library. The name of the pack is pack_name, and the name of the component is component_name.

Explanation: The version in the solution pack metadata library does not match the version in the component metadata library.

System action: Processing stops.

CCQI752S The release in the library_name solution pack metadata library is different than the release in the library_name component metadata library. The name of the pack is pack_name, and the name of the component is component_name.

Explanation: The release in the solution pack metadata library does not match the release in the component metadata library.

System action: Processing stops.

CCQI753S The modification level in the library_name solution pack metadata library is different than the modification level in the library_name component metadata library. The name of the pack is pack_name, and the name of the component is component_name.

Explanation: The modification level in the solution pack metadata library does not match the modification level in the component metadata library.

System action: Processing stops.

CCQO000W The XML structure of the member_name discover parameter metadata member is not valid. The PL/I XML parser issued the following exception warning code: code_number.

Explanation: While determining if the discover parameter metadata member is valid, the PL/I XML parser issued an exception warning code.

System action: Processing continues.

User response: See the Enterprise PL/I for z/OS Programming Guide for more information about the exception warning code.

CCQO001S The XML structure of the member_name discover parameter metadata member is not valid. The element_name element is unknown.

Explanation: The specified element in the discover parameter metadata member is unknown.

System action: Processing stops.

CCQO002S The XML structure of the member_name discover parameter metadata member is not valid. Content is not allowed for the element_name element, but content was found.

Explanation: The specified element cannot contain content.

System action: Processing stops.

CCQO004S  The XML structure of the member_name discover parameter metadata member is not valid. Content is required for the element_name element, but content was not found.

Explanation: The specified element is missing required content.

System action: Processing stops.

CCQO005S  The XML structure of the member_name discover parameter metadata member is not valid. The content length for the element_name element cannot exceed maximum_number characters.

Explanation: The specified element contains too many characters.

System action: Processing stops.

CCQO006S  The XML structure of the member_name discover parameter metadata member is not valid. The element_name element cannot occur more than maximum_number times.

Explanation: The specified element occurs too many times.

System action: Processing stops.

CCQO007S  The XML structure of the member_name discover parameter metadata member is not valid. The element_name element must occur at least minimum_number times.

Explanation: The specified element does not occur enough times.

System action: Processing stops.

CCQO008S  The XML structure of the member_name discover parameter metadata member is not valid. The attribute_name attribute in the element_name element cannot occur more than maximum_number times.

Explanation: The specified attribute occurs too many times.

System action: Processing stops.

CCQO009S  The XML structure of the member_name discover parameter metadata member is not valid. The attribute_name attribute in the element_name element must occur at least minimum_number times.

Explanation: The specified attribute does not occur enough times.

System action: Processing stops.

CCQO010S  The XML structure of the member_name discover parameter metadata member is not valid. Content is not allowed for the attribute_name attribute in the element_name element, but content was found.

Explanation: The specified attribute cannot contain content.

System action: Processing stops.

CCQO011S  The XML structure of the member_name discover parameter metadata member is not valid. Content is required for the attribute_name attribute in the element_name element, but content was not found.

Explanation: The specified attribute requires content.

System action: Processing stops.

CCQO012S The XML structure of the member_name discover parameter metadata member is not valid. The content length for the attribute_name attribute in the element_name element in the cannot exceed maximum_number characters.

Explanation: The specified attribute contains too many characters.

System action: Processing stops.

CCQO013S The XML structure of the member_name discover parameter metadata member is not valid. The attribute_name attribute in the element_name element is unknown.

Explanation: The specified attribute is unknown.

System action: Processing stops.

CCQO014S The content of the member_name discover parameter metadata member is not valid because the value of the element_name element is incorrect. The value is value_name.

Explanation: A The specified value for an element in the discover parameter metadata member is not valid.

System action: Processing stops.

CCQO015S The content of the member_name discover parameter metadata member is not valid because the value of the attribute_name attribute in the element_name element is incorrect. The value is value_name.

Explanation: The specified value for an attribute in the discover parameter metadata member is not valid.

System action: Processing stops.

CCQO052S The REXX_EXEC name Discover REXX EXEC was not found in the data_set_name Discover data set.

Explanation: Tools Customizer could not find the Discover REXX EXEC in the specified data set.

System action: Processing stops.

User response: Ensure that the Discover REXX EXEC is specified correctly.

CCQO051W The data_sharing_group_ID data sharing group ID cannot contain more than four characters.

Explanation: The specified data sharing group ID contains too many characters.

System action: Processing continues.

User response: Ensure that the specified data sharing group ID does not exceed four characters.

CCQO050S The data_set_name Discover REXX EXEC data set could not be initialized or was not found.

Explanation: Tools Customizer could not find or could not initialize the specified Discover REXX EXEC data set.

System action: Processing stops.

User response: Ensure that the Discover REXX EXEC is specified correctly.
**CCQO053W** The LPAR name LPAR name cannot contain more than eight characters.

_**Explanation:**_ The specified LPAR name contains too many characters.

_**System action:**_ Processing continues.

_**User response:**_ Ensure that the specified LPAR name does not exceed eight characters.

**CCQO054W** The subsystem ID DB2 SSID cannot contain more than four characters. The record was not processed.

_**Explanation:**_ The specified DB2 SSID contains too many characters.

_**System action:**_ Processing continues.

_**User response:**_ Ensure that the specified DB2 SSID does not exceed four characters.

**CCQO055W** The parameter name DB2 group attach name parameter is in the record name Discover record, but a DB2 group attach name was not specified. The record was not processed.

_**Explanation:**_ The Discover record contains a data sharing group parameter, but a DB2 group attach name was not specified.

_**System action:**_ Processing continues.

_**User response:**_ Ensure that information is specified correctly on the Discover Customized Component Information panel.

**CCQO056W** The Discover EXEC could not find the parameter_name parameter in the metadata for the component to be customized. The record was not processed.

_**Explanation:**_ The specified parameter could not be found in the metadata for the component to be customized.

_**System action:**_ Processing continues.

_**User response:**_ Ensure that information is specified correctly on the Discover Customized Component Information panel.

**CCQO057W** The component parameter name in the record type Discover record does not start with CCQ_LPR_, CCQ_DB2_, or CCQ_PRD_. The record was not processed.

_**Explanation:**_ The parameter in the record does not start with CCQ_DB2_, CCQ_LPAR_, or CCQ_PRD_.

_**System action:**_ Processing continues.

_**User response:**_ Ensure that information is specified correctly on the Discover Customized Component Information panel.

**CCQO058W** The parameter name component parameter in the record type Discover record did not have a DB2 group attach name or a DB2 SSID. The record was not processed.

_**Explanation:**_ The Discover record did not have a DB2 group attach name or a DB2 subsystem ID in the DB2 parameter.

_**System action:**_ Processing continues.

_**User response:**_ Ensure that information is specified correctly on the Discover Customized Component Information panel.

**CCQO059W** The parameter_name component parameter cannot contain more than 72 characters. The record was not processed.

_**Explanation:**_ The specified component parameter contains too many characters.

_**System action:**_ Processing continues.

_**User response:**_ Ensure that the specified component parameter does not exceed 72 characters.

**CCQO060W** The record_name Discover record from the REXX EXEC output must start with the following record type: record_type. The record was not processed.

_**Explanation:**_ A Discover record from the REXX EXEC output must start with the specified DB2 record type.

_**System action:**_ Processing continues.

**CCQO061I** If you do not have a previously customized version of the component, do not run the Discover EXEC. Press END to go to the Customizer Workplace panel.

_**Explanation:**_ This message is issued when you customize a component for the first time. It prompts you to use the Discover EXEC to discover data from a previous customization of the specified component.

_**System action:**_ Processing continues.
Tip: Using the Discover EXEC saves time and reduces errors that can occur when parameters are specified manually. If you want to use the Discover EXEC, specify the required information on the Discover Customized Component Information panel. Otherwise, press End to continue without discovering data from a previous customization of the component.

CCQO062W The Discover EXEC could not find the following parameter_name parameter in the DB2 metadata. The record was not processed.

Explanation: The specified parameter is missing in the DB2 metadata.

System action: Processing continues.

User response: If this parameter is required, contact IBM Software Support.

CCQO064W The Discover-record Discover record did not have a parameter name. The record was not processed.

Explanation: A parameter name was missing in the Discover record.

System action: Processing continues.

CCQO065W The value for the parameter_name parameter is ignored because it has more than maximum_number characters, which is the maximum length that is defined in the metadata. The value is parameter_value.

Explanation: The specified value exceeded the maximum allowed length, which was defined in the metadata. Tools Customizer truncated the extra characters.

System action: Processing continues.

CCQO066W The record_name Discover record from the Discover REXX EXEC output does not have a parameter value. The record was not processed.

Explanation: The Discover record was missing a parameter value from the Discover EXEC output.

System action: Processing continues.

User response: Ensure that information was specified correctly on the Discover Customized Component Information panel.

CCQO067W The parameter_name parameter is defined in the metadata to support one value, but more than one value was found. The last value was used.

Explanation: The definition of the parameter in the metadata supports one value, but more than one value was specified. Only the last value was used.

System action: Processing continues.

User response: Ensure that information was specified correctly on the Discover Customized Component Information panel.

CCQO068W The value of the parameter_name parameter is ignored because the parameter is defined as internal=true. The value is value_name.

Explanation: The specified value of the parameter is ignored because it is defined as internal=true.

System action: Processing continues.

User response: Ensure that information was specified correctly on the Discover Customized Component Information panel.

CCQO069W The Discover EXEC did not find the parameter_name parameter in the LPAR metadata. The record was not processed.

Explanation: The specified parameter is missing from the LPAR metadata.

System action: Processing continues.

User response: Ensure that information was specified correctly on the Discover Customized Component Information panel.

CCQO070W The record_type Discover record contains an incorrect delimiter between the Environment section and the Data section. The record was not processed.

Explanation: Tools Customizer found an incorrect delimiter between the Environment section and the Data section.

System action: None.

User response: No action is required.
CCQO071W The member_name member could not be found in the data_set_name Discover data set.

Explanation: Tools Customizer could not find the specified Discover data set.

System action: None.
User response: No action is required.

CCQO072S The member_name discover metadata member was not found in the data_set_name metadata data set.

Explanation: Tools Customizer could not find the specified metadata member in the data set.

System action: Processing stops.

CCQO073E The member_name discover metadata member is not valid because the default length for the element_name parameter element exceeds the length of the parameter. The default length is default_length, and the specified length is specified_length. The default length will be truncated accordingly.

Explanation: The default length for the specified parameter element is longer than the parameter.

System action: Processing continues.
User response: No action is required.

CCQO074S The content of the member_name discover metadata member is not valid. The value of the attribute_name attribute in the element_name element is not valid. The value of the attribute is value_name.

Explanation: The specified value is not valid.

System action: Processing continues.

CCQO075W The configuration_ID configuration ID in the record_name Discover record is incorrect. The record was not processed.

Explanation: The specified configuration ID is not correct.

System action: Processing continues.
User response: No action is required.

CCQO076W The configuration_ID configuration ID cannot contain more than maximum_number characters. The record was not processed.

Explanation: The specified configuration ID contains too many characters.

System action: Processing continues.
User response: No action is required.

CCQO077S The discover metadata member was not found in the data_set_name component data set that is part of the data_set_name pack.

Explanation: The discover metadata member was not found in the specified component data set.

System action: Processing stops.

CCQO078I Product_name does not support the Discover process.

Explanation: The specified product does not support the Discover process.

System action: None.
User response: No action is required.

CCQP000E The value of the mode_name DB2 mode is not valid for the level_name DB2 level.

Explanation: The specified DB2 mode is not valid for the DB2 level.

System action: Processing stops.
User response: Specify a valid DB2 mode for the DB2 level.

CCQP001E The value of the mode_name DB2 mode is missing.

Explanation: The specified DB2 mode is not defined.

System action: Processing stops.
User response: Specify a value for the DB2 mode.

CCQP002E The value of the mode_name DB2 level is missing.

Explanation: The specified DB2 level is not defined.

System action: Processing stops.
User response: Specify a value for the DB2 level.
CCQP003E  The value of the level_name DB2 level is not valid.
Explanation: The specified DB2 level does not have a valid name.
System action: Processing stops.
User response: Specify a valid value for the DB2 level.

CCQP004S  The parameter_name parameter does not exist in the CCQSSDB2 DB2 parameter metadata member.
Explanation: The CCQSSDB2 DB2 parameter metadata member does not contain the specified parameter.
System action: Processing stops.

CCQP005E  The value of the subsystem_ID DB2 SSID is missing.
Explanation: The specified DB2 SSID is not defined.
System action: Processing stops.
User response: Specify a valid value for the DB2 SSID.

CCQP006E  The value of the group_attach_name DB2 group attach name is missing.
Explanation: The specified DB2 group attach name is not defined.
System action: Processing stops.
User response: Specify a valid DB2 group attach name.

CCQQ000E  Specify a valid metadata library. Each qualifying of the library must start with an alphabetic character and must be 1-8 alphanumeric characters. The library name must be 1-44 characters.
Explanation: The metadata library was not specified in the correct format. The high-level qualifier must contain alphanumeric characters, and the first character cannot be numeric. The name cannot contain wildcard characters, such as asterisks (*) and percent signs (%).
System action: Tools Customizer prompts for the correct library name.
User response: Specify a library in the correct format. If the message was issued on the Specify the Metadata Library (CCQPHLQ) panel, specify the product metadata library. The name of this library is hlq.SDENU. Do not specify the Tools Customizer metadata library, which is hlq.SCCQDENU.

CCQQ001E  The data_set_name data set name that was specified for the metadata library was not found.
Explanation: The data set does not exist, or the data set name was written in the incorrect format. The high-level qualifier must contain alphanumeric characters, and the first character cannot be numeric. The name cannot contain wildcard characters, such as asterisks (*) and percent signs (%).
System action: Tools Customizer prompts for the correct data set name.
User response: Specify a data set name in the correct format.

CCQQ002E  The data_set_name data set name that was specified for the library_name metadata library cannot be opened.
Explanation: Tools Customizer could not open the data set.
System action: Tools Customizer prompts for an available data set.
User response: Ensure that the specified data set is available for Tools Customizer to open it.

CCQQ003E  The data_set_name data set name that was specified for the metadata sample library is not valid. The data set must be in the following format: HLQ.SxxxSAMP.
Explanation: The specified data set name was not specified in the correct format.
System action: None.
User response: Specify the data set name in the following format: HLQ.SxxxSAMP, where xxx is the three-character prefix for the component.

CCQQ004E  The data_set_name data set is being used by another user. Try again when the data set is not being used.
Explanation: Another user is using the specified data set.
System action: None.
User response: Ensure that the specified data set is not being used.

CCQQ009E  The data_set_name data set name that was specified for the metadata library is not valid because the data set is empty.
Explanation: The specified data set is empty.
System action: Tools Customizer prompts for an available data set.
User response: Ensure that the specified data set is available for Tools Customizer to open it.

CCQQ011E The library_name metadata library for the component that is part of the library_name pack was not found in the catalog. The name of the pack is pack_name, and the name of the component is component_name.
Explanation: The specified metadata library is not in the catalog.
System action: None.
User response: Specify another metadata library.

CCQS000I Tools Customizer is being invoked for the first time or the previous ISPF session ended before Tools Customizer was exited. In both cases, the fields on this panel are populated with default values. Review these default values or specify new values to be used to customize products or packs.
Explanation: When you customize a stand-alone product or a solution pack for the first time, or when an ISPF session unexpectedly ends before the ISPF profile is saved, you must specify or review your Tools Customizer user settings.
System action: Processing stops.
User response: Review and accept the default settings, or specify new settings.

CCQS001E Tools Customizer is being invoked for the first time or the previous ISPF session ended before Tools Customizer was exited. In both cases, the fields on this panel are populated with default values. Review these default values or specify new values to be used to customize products or packs.
Explanation: When you customize a stand-alone product or a solution pack for the first time, or when an ISPF session unexpectedly ends before the ISPF profile is saved, you must specify or review your Tools Customizer user settings.
System action: Processing stops.
User response: Review and accept the default settings, or specify new settings.

CCQS002W The data_set_name Discover data set could not be found.
Explanation: Tools Customizer could not find the specified data set.
System action: The data set will be allocated, and processing continues.
User response: Ensure that the data set name is specified correctly because the data set will be allocated with this name after the values are saved.

CCQS003W The data_set_name Discover data set was not found so it was created.
Explanation: Tools Customizer could not find the specified data set.
System action: Processing continues.
User response: Ensure that the data set name is specified correctly.

CCQS004I The settings were saved.
Explanation: The settings that you changed were saved.
System action: Processing continues.
User response: No action is required.

CCQS006W The length of a qualifier for the data_set_name customization library data set exceeds 26 characters.
Explanation: The qualifier for the customization library data set is too long. The qualifier cannot exceed 26 characters.
System action: Processing continues.
User response: Specify a qualifier that is 26 characters or less.

CCQS007E The discover data set data_set_name could not be opened with the option-type option.
Explanation: The specified option could not open the Discover data set.
System action: None.
User response: Specify a data set to which you have WRITE access.

CCQS008E An error occurred while the data_set_name Discover data set was being created.
Explanation: While the specified data set was being created, an error occurred.
System action: Processing continues.
**CCQS010E • CCQS022E**

**User response:** Ensure that you have WRITE authority access to this data set.

---

**CCQS010E** The customization library qualifier is not valid.

**Explanation:** The customization library qualifier that was specified is not valid.

**System action:** None.

**User response:** Specify a valid qualifier for the customization library.

---

**CCQS011E** The group attach option is not valid.

**Explanation:** The group attach option that was specified is not valid.

**System action:** None.

**User response:** Specify a valid option for the group attach option.

---

**CCQS012E** The Tools Customizer metadata library is not valid.

**Explanation:** The metadata library that was specified is not a valid data set.

**System action:** None.

**User response:** Specify a valid data set for the metadata library.

---

**CCQS013E** The Discover data set is not valid.

**Explanation:** The Discover data set that was specified is not a valid data set.

**System action:** None.

**User response:** Specify a valid Discover data set.

---

**CCQS014E** The data store data set is not valid.

**Explanation:** The data set that was specified is not a valid data set.

**System action:** None.

**User response:** Specify a valid data store data set.

---

**CCQS015E** Tools Customizer is already running.

**Explanation:** A session of Tools Customizer is already running in your environment. Only one Tools Customizer session is allowed.

**System action:** None.

**User response:** The trace data set is being used. Free the trace data set, and start Tools Customizer again.

---

**CCQS018E** Information on the first line of the job card exceeds 57 characters.

**Explanation:** The first line of the job card can contain only 57 characters. This character limit includes a continuation character.

**System action:** Tools Customizer clears the first line of the job card.

**User response:** Specify information that does not exceed 57 characters on the first line of the job card.

---

**CCQS019E** The required trace data set, data_set_name, is currently not accessible.

**Explanation:** The trace data set must be accessible.

**System action:** Processing stops.

**User response:** Ensure that the trace data set is accessible.

---

**CCQS020E** An error occurred while the customization library data set was being created. ALTER authority on the high-level qualifier for the customization library data set is required.

**Explanation:** To create the customization library data set, ALTER authority on the specified high-level qualifier must be granted.

**System action:** None.

**User response:** Ensure that ALTER authority for the specified customization library data set is granted.

---

**CCQS021E** The value value_name in the field that contains the cursor position is not valid.

**Explanation:** The specified value is not valid.

**System action:** None.

**User response:** Specify a valid value.

---

**CCQS022E** An error occurred while the customization library data set was being opened. UPDATE authority on the high-level qualifier for the customization library data set is required.

**Explanation:** To open the customization library data set, UPDATE authority on the specified high-level qualifier must be granted.

**System action:** None.

**User response:** Ensure that UPDATE authority for the specified customization library data set is granted.
CCQS023E  An error occurred while the customization library data set was being opened. UPDATE authority on the high-level qualifier for the customization library data set is required.

Explanation: To open the customization library data set, UPDATE authority on the specified high-level qualifier must be granted.

System action: None.

User response: Ensure that UPDATE authority for the specified customization library data set is granted, or specify a different high-level qualifier for the customization library data set on the Tools Customizer Settings panel.

CCQS024E  An error occurred while the customization library data set was being created. ALTER authority on the high-level qualifier for the customization library data set is required.

Explanation: To create the customization library data set, ALTER authority on the specified high-level qualifier must be granted.

System action: None.

User response: Ensure that ALTER authority for the specified customization library data set is granted, or specify a different high-level qualifier for the customization library data set on the Tools Customizer Settings panel.

CCQS030E  The following command is not a valid CREATE statement: command_statement.

Explanation: The specified CREATE command statement is invalid because it contains blanks or alphabetic characters.

System action: Processing stops.

User response: Specify a valid CREATE command statement. The correct syntax is CREATE nn, where nn is 1 - 99.

CCQS031E  The following command is not a valid CREATE statement: command_statement. The number that can be specified with the CREATE command is 1 - 99.

Explanation: The specified CREATE command statement is invalid because it contains either 0 or a number greater than 99.

System action: Processing stops.

User response: Specify a valid CREATE command statement. The correct syntax is CREATE nn, where nn is 1 - 99.

CCQS023E  CCQT005E  CCQT001E  CCQT002E  CCQT003I  CCQT004I  CCQT005I

Chapter 7. Troubleshooting and messages  271
CCQT006E  CCQT017I

User response: Specify a configuration ID that does not contain a colon.

CCQT006E  The configuration_ID configuration ID exists. Specify a different configuration ID.
Explaination: The specified configuration ID exists.
System action: Processing stops.
User response: Specify another configuration ID.

CCQT007E  The configuration_ID configuration ID exists but was removed from the list of configurations. To use this configuration ID, you must restore it.
Explaination: The specified configuration ID exists but was removed from the list of available configuration.
System action: Processing stops.
User response: Specify another configuration ID. To restore the specified configuration ID, issue the CREATE command, and specify the same configuration ID again.

CCQT008E  The configuration_ID configuration ID exceeds maximum_number characters.
Explaination: The specified configuration ID contains too many characters.
System action: Processing stops.
User response: Specify another configuration ID that does not exceed the maximum number of characters that was set by.

CCQT010I  Create request for configuration_ID configuration was cancelled by user.
Explaination: The request to create the specified configuration was canceled.
System action: Processing stops.
User response: No action is required.

CCQT011I  The configuration_ID configuration was not removed.
Explaination: The specified configuration was not removed.
System action: Processing stops.
User response: No action is required.

CCQT012I  The command_name command is not allowed during the process of "Select" configuration line command.
Explaination: The specified command is not allowed while the line command for selecting configurations is processing.
System action: Processing stops.
User response: Remove the specified line command.

CCQT013I  None of the configurations were copied or removed. All of the previously selected configurations are deselected.
Explaination: The selected configurations were not copied or removed, and they are deselected.
System action: Processing stops.
User response: No action is required.

CCQT014E  Specify Y or N and press Enter to continue, or press End to cancel.
Explaination: A function requires input.
System action: Processing stops.
User response: To continue, specify Y or N and press Enter. Otherwise, press End to cancel.

CCQT015E  The configuration_ID configuration was not created.
Explaination: The specified configuration was not created.
System action: Processing stops.
User response: No action is required.

CCQT016I  The configuration_ID configuration was not copied.
Explaination: The specified configuration was not copied.
System action: Processing stops.
User response: No action is required.

CCQT017I  The configuration_ID configuration was not copied.
Explaination: The specified configuration was not copied.
System action: Processing stops.
User response: No action is required.
CCQT018E Specify Y or N, and press Enter.
Explanation: A function requires input.
System action: Processing stops.
User response: To continue, specify Y or N, and press Enter.

CCQT019I The select configuration_ID configuration process ended.
Explanation: The select process for the specified configuration is finished.
System action: Processing stops.
User response: No action is required.

CCQT020E The configuration_ID configuration was not created because the data store was not accessible.
Explanation: The specified configuration was not created because the data store could not be accessed.
System action: Processing stops.
User response: Ensure that the data store is accessible and create the configuration again.

CCQT021E The configuration_ID configuration was not copied because the data store was not accessible.
Explanation: The specified configuration was not copied because the data store could not be accessed.
System action: Processing stops.
User response: Ensure that the data store is accessible and copy the configuration again.

CCQT025I The configuration_ID configuration was not updated.
Explanation: The specified configuration was not updated because the edit process was canceled.
System action: Processing stops.
User response: No action is required.

CCQT027I The component configuration was successfully updated.
Explanation: The configuration was updated.
System action: Processing continue.
User response: No action is required.

CCQX001S Product_name has already been customized by using values from data_set_name data store data set. Switch to the specified data store data set to continue customizing this product.
Explanation: The specified product was customized by using values from the specified data store data set.
System action: Processing stops.
User response: Use the specified data store data set to continue customizing the product.

CCQX002S component_name has already been customized by using values from data_set_name data store data set. Switch to the specified data store data set to continue customizing this component.
Explanation: The specified component was customized by using values from the specified data store data set.
System action: Processing stops.
User response: Use the specified data store data set to continue customizing the component.

CCQX011I component_name was not found.
Explanation: The specified component was not found.
System action: Processing stops.
User response: Specify another component.
Chapter 8. Reference

Use DB2 Automation Tool, DB2 High Performance Unload, DB2 Sort, and DB2 Utility Enhancement reference information when you need more information about the customization of the components. You can find details about the tasks, steps, and parameters that are displayed on the Component Parameters panel, and information about the generated jobs.

Tools Customizer terminology and data sets

Before you use Tools Customizer, you should understand the Tools Customizer terminology and the data sets that Tools Customizer uses during customization.

Tools Customizer terminology

Tools Customizer uses several unique terms that you should be familiar with before you begin to use Tools Customizer.

Products and components

How an IBM Tool is packaged determines whether it is referred to as a product or as a component in the Tools Customizer documentation and interface. An IBM Tool that is ordered as a stand-alone entity (that is, not as part of a solution pack) is referred to as a product. An IBM Tool that is part of a solution pack is referred to as a component. Some IBM Tools are available in both formats; therefore, the same IBM Tool can be referred to as a product or as a component depending on how it is packaged.

DB2 entry

You can customize a component on one or more DB2 entries. A DB2 entry can be any of the following items:

DB2 subsystem

A distinct instance of a relational database management system (RDBMS) that is not part of a data sharing group. An example of a DB2 subsystem name is DB01.

DB2 group attach name

The name that is used by the TSO/batch attachment, the call attachment facility (CAF), DL/I batch, utilities, and the Resource Recovery Services attachment facility (RRSAF) as a generic attachment name. An example of a group attach name is DSG1.

Tools Customizer does not support DB2 group attach names.

DB2 data sharing member

A DB2 subsystem that is assigned by the cross-system coupling facility (XCF) to a data sharing group. An example of a DB2 data sharing member name is DB02.

Tools Customizer maintains the following lists of DB2 entries:

Associated list

The list of DB2 entries that are associated with a component. If the component to be customized requires DB2 entries, you can customize the component only on DB2 entries that are in the associated list. When you customize a component, this list is
displayed in the DB2 Entries, Associations, and Parameter Status section of the Customizer Workplace panel.

You can add and copy DB2 entries to the associated list. When you add or copy DB2 entries to the associated list, the entries are associated with the component.

**Master list**

The list of all DB2 entries that are defined but are not associated with a component. Tools Customizer obtains information about these DB2 entries either from entries that were created manually or from the customizations of other components that were discovered. If you remove a DB2 entry from the associated list, the DB2 entry is added to the master list. When you create a new DB2 entry, it is added to the master list, and when you associate the new entry with a component, it is removed from the master list and added to the associated list. The master list is displayed on the Associate a DB2 Entry for Component panel.

If the associated list does not have the DB2 entries on which you want to customize a component, you can associate existing entries from the master list to the associated list.

You can create new DB2 entries and copy existing entries to the master list.

**High-level qualifier**

The high-level qualifier is considered to be all of the qualifiers except the lowest level qualifier. A high-level qualifier includes a mid-level qualifier.

**Component parameters**

Parameters that are specific to the component. These parameters are defined by the component and are stored in a data member that is defined by the component.

**LPAR parameters**

Parameters on the local LPAR that are required to customize. These parameters are defined by Tools Customizer and are stored in an LPAR parameter data member.

**DB2 parameters**

Parameters for a DB2 entry. These parameters are defined by Tools Customizer and are stored in a DB2 parameter data member.

**Status type**

**Component, LPAR, and DB2 entry status type**

After you specify the component that you want to customize, the component, the LPAR, and the DB2 entries have a status. The status is partly based on whether required parameters are defined. For some components, LPAR parameters or DB2 parameters might not be required. In these cases, the status is Not Required.

To customize a component, all of the required parameters must be defined.

If required parameters for the component parameters, LPAR parameters, or DB2 parameters are not defined, the status of the parameters is Incomplete. Define values for parameters by manually editing them or by generating the customization jobs and specifying values for all of the required parameters that are displayed on the panels.
When values for all of the required parameters are defined, the status is Ready to Customize. Customization jobs can be generated only when all of the required parameters are defined and the status is Ready to Customize or Customized for the component parameters, LPAR parameters, and DB2 parameters for the DB2 entries on which a component will be customized.

The following table shows the meaning of the status types. Each status is defined differently for each type of parameter.

<table>
<thead>
<tr>
<th>Status</th>
<th>Component</th>
<th>LPAR</th>
<th>DB2 entries</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incomplete</td>
<td>The required component parameters are not defined, or the required component parameters are defined but LPAR parameters, DB2 parameters, or both are not defined.</td>
<td>The required parameters are not defined.</td>
<td>The required parameters are not defined.</td>
</tr>
<tr>
<td>Discovered</td>
<td>The component parameter definitions were discovered by using the component Discover EXEC.</td>
<td>N/A</td>
<td>N/A</td>
</tr>
<tr>
<td>Ready to Customize</td>
<td>The required component, LPAR, and DB2 parameters are defined, the status is Ready to Customize or Customized for the LPAR and at least one associated DB2 entry. You can generate the customization jobs.</td>
<td>The required LPAR parameters are defined or LPAR parameters are not required.</td>
<td>The required DB2 parameters are defined or DB2 parameters are not required.</td>
</tr>
<tr>
<td>Customized</td>
<td>The jobs are customized on the local LPAR.</td>
<td>The jobs are customized for the product or for all of the associated DB2 entries on the local LPAR.</td>
<td>The jobs are customized for the DB2 entry.</td>
</tr>
<tr>
<td>Errors in</td>
<td>N/A</td>
<td>N/A</td>
<td>Errors occurred while the customization jobs were being generated.</td>
</tr>
<tr>
<td>Customization</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Not Required</td>
<td>N/A</td>
<td>LPAR parameters are not required.</td>
<td>DB2 parameters are not required.</td>
</tr>
</tbody>
</table>

**Component status type**

Each of the components in a solution pack has a status, and the status is partly based on whether the component is customized.

The following table shows the meaning of the status types.
Table 20. Status types for the component, the LPAR, and the DB2 entries

<table>
<thead>
<tr>
<th>Status</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Customized</td>
<td>The customization process is finished, and the component is customized.</td>
</tr>
<tr>
<td>Pending Customization</td>
<td>The customization process is not finished, and the component is not customized.</td>
</tr>
<tr>
<td>Not Found</td>
<td>The metadata library for the component was not found.</td>
</tr>
<tr>
<td>Not Applicable</td>
<td>The component cannot be customized by using Tools Customizer.</td>
</tr>
</tbody>
</table>

Related tasks:

- “Creating and associating DB2 entries” on page 181
  You can create new DB2 entries and associate them with components in the DB2 Utilities Solution Pack.
- “Copying DB2 entries” on page 191
  You can copy associated and not associated DB2 entries to other DB2 entries or to new DB2 entries.
- “Removing DB2 entries” on page 193
  You can remove DB2 entries from the associated list.

Data sets that Tools Customizer uses during customization

Tools Customizer uses several unique data sets during the customization process. Familiarize yourself with these data sets before you begin to use Tools Customizer.

Several different data sets are required to customize component with Tools Customizer. These data sets are supplied by component, supplied by Tools Customizer, or allocated by Tools Customizer.

The pack provides the following data sets:

**Metadata library**
Contains the metadata for the pack to be customized. Tools Customizer uses the metadata to determine which tasks, steps, and parameters to display on the Component Parameters panel, the LPAR Parameters panel, and the DB2 Parameters panel. This data set also contains the templates that Tools Customizer uses to generate the customization jobs.

The metadata library naming convention is `high_level_qualifier.SBBYDENU`, where `high_level_qualifier` is all of the segments of the data set name except the lowest-level qualifier.

You specify the metadata library on the Specify the Metadata Library panel. READ access to this data set is required.

**Discover EXEC library**
Contains the component Discover EXEC. Each component in the pack has a unique Discover EXEC. When you customize a component, you can use the Discover EXEC to automatically retrieve and store component information, such as parameter values from an already customized component. Tools Customizer saves the discovered information in the data store.

The default name of the data set is the high-level qualifier for the metadata library plus a lowest-level qualifier. For example, the lowest-level qualifier for most components is `SXYZDENU`, where `XYZ` is the three-character...
component prefix. You can change the default value on the Discover Customized Component Information panel. EXECUTE access to this data set is required.

Tools Customizer provides the following data sets:

**Tools Customizer metadata library**
Contains the metadata for the DB2 and LPAR parameters that are required to customize components in the DB2 Utilities Solution Pack. Tools Customizer uses the metadata to determine which parameters to display on the DB2 Parameters panel and the LPAR Parameters panel. In addition, Tools Customizer uses information in the metadata library to determine whether additional DB2 and LPAR parameters need to be displayed on these panels. As you customize different components, different DB2 and LPAR parameters might need to be defined.

The default name of the data set is DB2TOOL.CCQ110.SCCQDENU. You can change the default value on the Tools Customizer Settings panel. READ access to this data set is required.

**Tools Customizer table library**
Stores information about jobs that are customized. Job information that is stored includes a description of the job, its member name and template name, the SSID, group attach name, and when the job was generated.

The default name of the data set is DB2TOOL.CCQ110.SCCQTENU. WRITE access to this data set is required.

Tools Customizer requires that the following data sets exist during the customization process. If the data sets do not exist, Tools Customizer automatically allocates them.

**Discover output data set**
Contains the output that is generated when you run the component Discover EXEC. The component Discover EXEC retrieves the metadata and values for the parameters from a previous customization of the component.

The default name of the data set is DB2TOOL.CCQ110.DISCOVER. You can change the default value on the Tools Customizer Settings panel or the Discover Customized Component Information panel. WRITE access to this data set is required.

**Data store data set**
Contains component, LPAR, and DB2 parameter values, and DB2 entry associations. Tools Customizer uses this data set to permanently store all information that is acquired about the component, DB2 subsystems or data sharing groups, and LPAR when you customize products on the local LPAR.

The default name of the data set is DB2TOOL.CCQ110.DAStOR. You can change the default value on the Tools Customizer Settings panel. WRITE access to this data set is required.

**Customization library**
Contains the customization jobs that Tools Customizer generates for the component.

Tools Customizer checks whether a customization library name was specified for more than one instance of the same version of the same product. If the same customization library name is specified for more than one product of the same version, the CCQD123E message is issued to
prevent you from overwriting previously generated customization jobs. Ensure that you specify unique qualifier for the customization library for each instance of the product.

To customize a component, submit the members of the data set in the order in which they are displayed on the Finish Component Customization panel.

The data set naming convention is $hlq$.LPAR_name$.xyzvrm$, where:

- $hlq$ is the value of the **Customization library qualifier** field on the Tools Customizer Settings panel (CCQPSET)
- **LPAR_name** is the four-character LPAR name
- $xyzvrm$ is the three-letter pack identifier with the version, release, and modification level

For example, the data set name might be DB2TOOL.PRODUCT.CUST.$MVS1$.XYZ410.

WRITE access to this data set is required.

Tools Customizer allocates the data sets for the discover output, the data store, and the customization library with the attributes that are shown in the following table:

Table 21. Data set attributes for allocating the Discover output, data store, and customization library data sets

<table>
<thead>
<tr>
<th>Data set</th>
<th>Organization</th>
<th>Record format</th>
<th>Record length</th>
<th>Block size</th>
<th>Data set name type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discover output data set</td>
<td>PO</td>
<td>Variable block</td>
<td>16383</td>

<td>LIBRARY</td>
</tr>
<tr>
<td>Data store data set</td>
<td>PO</td>
<td>Variable block</td>
<td>16383</td>
<td>32760</td>
<td>LIBRARY</td>
</tr>
<tr>
<td>Product customization library</td>
<td>PO</td>
<td>Fixed block</td>
<td>80</td>
<td>32720</td>
<td>LIBRARY</td>
</tr>
</tbody>
</table>

Restrictions:

- Multiple users cannot simultaneously share the discover output data set, data store data set, Tools Customizer metadata library, and metadata library.
- You cannot share the data store data set across multiple LPARs with shared DASD or copy the data store data set to another LPAR. Tools Customizer creates many cross-references between product and DB2 associations. Therefore, if you share or copy the data store data set, member names that are empty or that do not exist might be generated.

How to read syntax diagrams

The following rules apply to the syntax diagrams that are used in this information:

- Read the syntax diagrams from left to right, from top to bottom, following the path of the line. The following conventions are used:
  - The >>> symbol indicates the beginning of a syntax diagram.
  - The --> symbol indicates that the syntax diagram is continued on the next line.
- The >--- symbol indicates that a syntax diagram is continued from the previous line.
- The --->< symbol indicates the end of a syntax diagram.
- Required items appear on the horizontal line (the main path).

```
(required_item)
```

- Optional items appear below the main path.

```
(required_item)
  (optional_item)
```

If an optional item appears above the main path, that item has no effect on the execution of the syntax element and is used only for readability.

```
(required_item)
  (optional_item)
```

- If you can choose from two or more items, they appear vertically, in a stack.
  If you must choose one of the items, one item of the stack appears on the main path.

```
(required_item)
  (required_choice1-
   (required_choice2)
```

If choosing one of the items is optional, the entire stack appears below the main path.

```
(required_item)
  (optional_choice1-
   (optional_choice2)
```

If one of the items is the default, it appears above the main path, and the remaining choices are shown below.

```
(required_item)
  (default_choice-
   (optional_choice-
    (optional_choice)
```

- An arrow returning to the left, above the main line, indicates an item that can be repeated.

```
(required_item)
  (repeatable_item)
```

If the repeat arrow contains a comma, you must separate repeated items with a comma.

```
(required_item)
  (repeatable_item,
   (repeatable_item)
```

Chapter 8. Reference 281
A repeat arrow above a stack indicates that you can repeat the items in the stack.

- Keywords, and their minimum abbreviations if applicable, appear in uppercase. They must be spelled exactly as shown. Variables appear in all lowercase italic letters (for example, column-name). They represent user-supplied names or values.
- Separate keywords and parameters by at least one space if no intervening punctuation is shown in the diagram.
- Enter punctuation marks, parentheses, arithmetic operators, and other symbols exactly as shown in the diagram.
- Footnotes are shown by a number in parentheses; for example, (1).
Notices

This information was developed for products and services offered in the U.S.A.

This material may be available from IBM in other languages. However, you may be required to own a copy of the product or product version in that language in order to access it.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not give you any license to these patents. You can send license inquiries, in writing, to:

IBM Director of Licensing
